Hiring Team, MongoDB

Your req asks for a product manager who turns customer health data into platform decisions instead of just managing a backlog. At Pixis I cut client churn 50% for an 8-client AI-platform portfolio by reading account health signals in Amplitude and Tableau and turning them into proactive playbooks and channel diversification, then feeding what I found straight back into the product. That loop, read the signal, build the workflow, close it with the customer, is exactly what this Post Sales PM req is built on.

I have also automated the workflows support teams actually live in. At Plug Power I rebuilt the Salesforce-anchored Mar-Tech stack (Salesforce, Adobe Analytics, GA, Google Tag Manager) for closed-loop reporting, and today at Applied Materials I build AI agents on Claude to automate the repetitive analysis work that used to eat a day each week. Pointing that same automation instinct at case routing, omni-channel support and knowledge-sharing workflows is a natural next step, not a stretch.

The platform side of the role is familiar ground too. At Sensata I own the roadmap and a 100+-feature backlog for sensor solutions, writing PRDs and running Agile sprints with engineering across 3 regions, and I turned SQL and GA4 telemetry from 50K+ connected devices into KPI frameworks that lifted feature adoption 18%. Running 30+ structured interviews along the way raised CSAT 22%, the same customer-needs-to-platform-capability work this role is asking for.

I would like to bring that combination, customer health instinct from Pixis, Salesforce-anchored workflow automation, and PRD-to-release discipline from Sensata, to MongoDB's Post Sales platform. Proof trail at adhi-product-ai.vercel.app/ref/mongodb.
