

PITCH DECK | BASETEN REVENUE STRATEGY & OPERATIONS, SR. ANALYST

One seat here owns GTM planning, the pipeline generation model, the weekly forecast process and the experiments that test new GTM motions. I have already run every piece of that loop, just not on a consumption-priced product yet.

Forecast-cadence ownership, pipeline-health analytics and coverage-model discipline from someone who builds the dashboard that makes a pipeline defensible, not just visible.

1,200 opportunities tracked against a \$627M target across 3 regions, 4 product families, 20 lines

53% to 61% distributor margin lift from repriced coverage logic

\$700K+ margin recovered in 2 quarters via win/loss-driven pipeline review

CRM + CPQ + forecast cadence run end to end, founder of PriceKeel

Claude AI agents automating recurring pipeline analysis at Applied Materials

This is a foundational hire on a brand-new function, which means the plan, the pipeline model and the forecast **all get built at the same time, by one person.**

What building all three at once runs into

A GTM plan without a pipeline generation model behind it is a headcount number nobody can defend at the next QBR. A forecast without a clean weekly cadence becomes a number the CRO stops trusting after the first miss.

On a foundational team, Central Ops, Finance and field leadership all pull on the same model at once, so a gap in coverage logic or segmentation becomes everyone's guessing game, not just one team's.

The fix is not another spreadsheet. It is someone who has already built the plan, the pipeline model and the forecast cadence as one connected system, not three separate deliverables.

What I have already run

At **Sensata**, I built the pipeline system that tracked 1,200 opportunities against a \$627M target, with the segmentation, win-rate and stage-distribution logic a coverage model needs to hold up under scrutiny.

At **PriceKeel**, I run the forecast cadence, pipeline reviews and CRM/CPQ configuration for my own company, so the plan and the pipeline are never two different stories.

Both mean I have sat on the planning side and the system-ownership side of the same loop, not just one or the other.

A foundational Sr. Analyst who owns GTM planning, pipeline generation, weekly forecast and new-motion experiments is describing exactly that loop: build the plan, build the model that feeds it, then test what breaks it next quarter.

What the Sr. Analyst role covers, and where the proof already sits.

What the role covers

- GTM Planning, Target Setting & Market Intelligence: annual/quarterly GTM planning, headcount modeling, coverage models, segmentation logic.*
- Pipeline Generation & Forecast: pipeline generation model, PG cadence, weekly forecast process, analytics layer.*
- Field Execution & Plan Refinement: identify gaps, analyze regional pipeline health, win/loss trends.*
- New Motions & Experimentation: design and execute structured experiments for new GTM approaches.*

My Proof

- Coverage and segmentation logic:** built the Bleeders and Leakers system segmenting 1,200 opportunities by region, product family and product line against a \$627M target.
- Pipeline generation and forecast cadence:** run PriceKeel's own forecast and pipeline-review cadence end to end, and shaped Sensata's AP26 revenue models with senior executives.
- Regional pipeline health and win/loss:** built the win-rate, average-\$-per-win and stage-distribution reporting by salesperson that surfaced \$433M in margin gaps for leadership to act on.
- Structured experimentation:** ran 8+ A/B tests and 12+ user interviews shipping SwipeHire zero-to-one, and built the discount guardrail engine at PriceKeel that tests new pricing logic against real deal history.

Bleeders and Leakers: make the pipeline defensible before it reaches a leadership review.

Built as a BU-wide Power BI system covering 1,200 pipeline opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, with a pipeline funnel, regional scorecards, win rate, average \$/win and stage distribution checked before leadership set the next quarter's targets.

At PriceKeel that same instinct became the operating model: I run the CRM, CPQ configuration and forecast cadence myself, so the plan and the pipeline are never two different stories, and I automate the recurring analysis with AI agents built on Claude at Applied Materials.

What the first month on Baseten's GTM Strategy and Revenue Operations team looks like.

WEEK 1 Learn the current plan and the forecast cadence Sit with the Head of Revenue Operations, Finance and field leadership to walk the current GTM plan, coverage model and weekly forecast process, and shadow one PG cadence cycle end to end. ----- Why first: the same instinct that had me learn PriceKeel's own CRM and CPQ configuration before building anything on top of it.	WEEK 2-3 Own one region's pipeline health review Take ownership of one region's pipeline generation and forecast analytics, confirm the segmentation logic, and present win/loss trends and coverage gaps at the next field execution review. ----- Why now: the same regional-scorecard discipline that made the Bleeders and Leakers dashboard usable in a leadership review.	WEEK 4 Design one new-motion experiment Propose and scope one structured experiment for a new GTM approach flagged in the Week 2-3 review, with a clear hypothesis, success metric and a plan to fold the result back into the coverage model. ----- Why this fast: a new-motions program only earns its keep if the first test ships before the next planning cycle, not after it.

CLOSE

You are hiring someone to build the GTM plan, the pipeline model and the forecast at the same time, on a brand-new team. I have already run that loop end to end.

The core proof is Sensata: a Power BI system tracking **1,200 opportunities against a \$627M target**, distributor margins lifted **from 53% to 61%**, and \$700K+ in margin recovered in 2 quarters through win/loss-driven pipeline review.

What is harder to find is someone who has also spent the last several months owning the CRM, CPQ configuration and forecast cadence for his own company's pipeline. **I built that at PriceKeel**, so the planning-plus-system-ownership loop this role runs is not something I would need to learn on the job.
