Hiring Team, Baseten

The FY2026 Bleeders and Leakers dashboard I built at Sensata tracked 1,200 pipeline opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, with win rate, average deal size and stage distribution broken out by salesperson. That is close to the pipeline generation model and regional pipeline health analysis your posting is asking someone to own, just running on industrial parts instead of AI infrastructure.

I know what it is like to sit between field, finance and leadership, because that is where I have run every forecast cadence since 2020. At Sensata I shaped the AP26 revenue models with senior executives; at PriceKeel I run my own company's forecast and pipeline reviews end to end, from CRM configuration to the deal-approval call. That second one is not a hypothetical. It is my own coverage model and my own segmentation logic, and I have had to defend every number in it to the people writing the checks.

At Applied Materials I forecast inflection points across multiple product groups so pricing and coverage keep pace with a market that moves in bursts, the same bursty-demand problem a consumption business runs into. I also build the way your posting asks for: SQL and Power BI for the analytics layer, AI agents built on Claude to cut the manual work out of a recurring cycle, and a discount guardrail engine at PriceKeel that reads closed-won and closed-lost history the way a segmentation model should.

A foundational hire on a GTM Strategy and Revenue Operations team is a plan-while-you-build role, and I would rather show that with a number than a list of adjectives. Proof trail at adhithyabhaskar.vercel.app/ref/baseten.
