Hiring Team, Hitachi Vantara

At Sensata I took a sensing feature a customer could not parse on its own and turned it into a value proposition an OEM buyer would sign off on before the demo, lifting conversion 15% on priority launches. That is the translation-under-pressure work your posting describes: take complex infrastructure technology and turn it into a market story, a differentiated narrative, and a tool a seller can actually use when a buyer is asking why this matters to them.

The Business Applications & Databases domain is new ground, but the mechanics are not. At Applied Materials I build one market view by pulling input from Sales, Engineering and Accounts instead of inheriting someone else's narrative, then set value-based pricing and forecast where a fast-moving technical market is heading next quarter, because a position that is right today is stale in three months. At Sensata I ran 30+ interviews with OEMs and distributors to find what was actually blocking adoption, mapped competitor positioning across EMEA and the US, and built the sales enablement, decks and case studies that took a 50-rep team's win rate up 30%. That is the same evidence-to-asset loop this role runs for enterprises whose database and application uptime is a board-level problem, not an IT one.

I also carried P&L and revenue targets on a multi-$100M business as Sensata's Pricing Lead, built multimillion-dollar customer quotes with senior executives, and drove +12% YoY revenue off competitive benchmarking across 10+ players, so I am used to the stakes of a regulated, multi-stakeholder buying committee rather than a single champion. I run AI agents built on Claude weekly to speed up research and forecasting, the same AI/LLM fluency called out for accelerating go-to-market work here.
