PITCH DECK | ASHBY PRODUCT MANAGER, ONBOARDING AND GROWTH

# Your surface area is outgrowing what Customer Success can onboard by hand. I have already owned that exact handoff, from a human-run process to a product and metrics that run it themselves.

*End-to-end onboarding ownership, research-first roadmapping and a Customer Success background, from someone who has shipped two products from a blank page.*

- **50+ users** onboarded on SwipeHire, built zero-to-one solo
- **100+ feature backlog** owned end to end at Sensata, time-to-market -20%
- **30+ interviews** found where onboarding broke, CSAT +22%
- **8-person CS team**, 8 accounts, churn -50%
- **SQL/GA4 KPI framework**, feature adoption +18%

WHY THIS DECK EXISTS

# Onboarding stops scaling the moment it depends on a person instead of a product, and that moment looks like it has already arrived.

### What happens without a single owner

A human-run onboarding motion scales with headcount, not with the product. As the surface area grows and new products launch, Customer Success keeps doing more individual hand-holding instead of the product doing more of the work.

Without one owner, Product, Customer Success and RevOps each define "onboarded" differently, and a Product Qualified Lead gets defined three separate times before anyone routes it.

The fix is not another dashboard. It is one person who treats discovery, the onboarding design and the adoption metric as a single job, not three handoffs.

### What I have already run

At **Pixis**, I ran an 8-person Customer Success team across 8 accounts and cut churn 50% by building account strategy on actual usage data instead of renewal-date urgency, the same proactive, persona-deep relationship Ashby's CS team already owns.

At **Sensata**, I turned raw SQL and GA4 usage data into a KPI framework that told us which signals actually predicted adoption, then owned the 100+ feature roadmap built on top of it.

On **SwipeHire**, I owned onboarding from signup to first match alone, end to end, with no team to hand pieces to.

**A single owner for the customer journey, who defines adoption metrics independently, partners tightly with Customer Success, and owns the Product Qualified Lead definition with RevOps, is describing a job I have done in pieces across three roles and now want to do as one.**

THE REQ, MAPPED

# What the onboarding and growth opening asks for, and where the proof already sits.

## What the role covers

> *Gain a deep understanding of the entire Customer Journey, then design a thoughtful onboarding experience for each role and stakeholder.*

> *You'll be responsible for defining and tracking key metrics to assess whether onboarding helps customers realize value sooner.*

> *Own the definition of a Product Qualified Lead and work with the RevOps team to determine how to route them.*

> *Exceptional relationships with customer success teams; a growth strategy rooted in principled thinking, research and data, not just A/B testing.*

## My Proof

**Customer journey depth:** owned SwipeHire's onboarding flow end to end from signup to first match, and ran 30+ OEM and distributor interviews at Sensata to map where onboarding actually broke.

**Adoption metrics, built solo:** turned SQL/GA4 data on 50K+ devices into a KPI framework that flagged high-intent cohorts and lifted feature adoption 18%, with no dedicated data team.

**PQL-adjacent discipline:** modeled where revenue value was leaking in Power BI and defended that definition with Sales before a dollar moved, the same rigor a PQL definition needs before RevOps will route against it.

**CS relationships, not theory:** was the Customer Success Manager running an 8-person team across 8 accounts, cutting churn 50% on usage-based account strategy, not test variants.

THE PROOF, IN DEPTH

# SwipeHire: own onboarding end to end, research first, then verify with real users.

Built solo from a blank page: wrote the PRD, scoped the MVP, and owned the onboarding flow from signup to first match on Python, OpenAI's API and React, with no team to hand pieces to.

**50+**

**Early Users Onboarded**

Shipped zero-to-one solo, the same full-stack ownership this role asks for across onboarding, email and feature changes.

**12+**

**User Interviews**

Found exactly where job seekers stalled in onboarding before touching the flow, "principled thinking and research" in practice, not a test guess.

**+25%**

**Activation Lift**

8+ A/B tests on the onboarding flow itself confirmed what the research found, evidence layered on evidence.

At Sensata that same research-first discipline scaled to a 100+ feature backlog across 3 regions, owned end to end with engineering, cutting time-to-market 20% and lifting CSAT 22% off 30+ customer interviews.

FIRST 30 DAYS

# What the first month owning onboarding and growth at Ashby looks like.

WEEK 1

### Live the customer journey, role by role

Sit with Customer Success on live onboarding calls, read the tickets and feature requests already on file, and map how onboarding differs for each role and stakeholder across an organization.

**Why first:** the same instinct that had me run 30+ interviews at Sensata before trusting a roadmap call.

WEEK 2-3

### Draft the first adoption metric and PQL definition

Partner with the data team to define a metric tied to customers realizing value sooner, not just activity, and bring RevOps a first-pass PQL definition built on real product signals to pressure-test.

**Why now:** the same KPI-from-scratch work that shipped Sensata's adoption framework.

WEEK 4

### Ship one onboarding or transactional email change

Take one piece of the onboarding experience, product feature or transactional email, from problem definition through a shipped change with engineering, and bring the adoption data back to defend the next move.

**Why this fast:** the same end-to-end habit that shipped SwipeHire's MVP without a team behind it.

CLOSE

# You are hiring a single owner for the customer journey who can define adoption metrics and partner with Customer Success. I have already run both halves of that job.

The Customer Success half is literal: I ran an **8-person CS team** across 8 accounts and cut churn **50%** on usage-based account strategy, the exact partnership depth this role is built to productize into a product motion.

The product half is SwipeHire and Sensata: a zero-to-one onboarding flow built solo to **50+ users**, and a **100+ feature backlog** and SQL/GA4 adoption framework owned end to end at Sensata, cutting time-to-market 20% and lifting adoption 18%. Research first, evidence always, is not new territory, it is the job I already do.
