Hiring Team, Stripe

Bridge's issuance platform has to make reserve, mint/burn and liquidity calls in real time and still leave a trail someone can audit later. I have run that exact tradeoff on the finance side: as Pricing Lead at Sensata I recovered $700K+ in margin in two quarters by building a guardrail that flagged which line items to reprice and a record Finance could sign off on without re-deriving the logic. Moving that discipline into stablecoin reserves and rewards is a change of domain, not a change of skill.

I also know what it takes to ship a platform feature end to end across regions. At Sensata I owned a 100+ feature backlog with Engineering in Agile across 3 regions, cutting releases 25% and time-to-market 20%, then ran 30+ interviews with OEMs and distributors in non-English, international markets to find where the platform broke for them before it broke for customers. That is the same ideation-to-launch loop Issuance needs when it moves from one compliant stablecoin market into the next.

SwipeHire is the build that shows I can take a product from a blank PRD to real users myself: I scoped the MVP, shipped eligibility-aware matching logic in Python and the OpenAI API, and priced three subscription tiers off competitor and willingness-to-pay data before onboarding 50+ users. Small scale, same muscle: ship a feature, price it, measure it, iterate again.

I would like to talk about what Issuance is prioritizing next on the roadmap. Proof trail at adhi-product.vercel.app/ref/stripe.
