Hiring Team, Glean

The dashboard I built at Sensata, the FY2026 Bleeders and Leakers model, tracked 1,200 pricing opportunities against a \$627M target and turned raw deal data into something leadership could actually act on, surfacing \$433M in margin gaps across 3 regions. That is the same jump your Mountain View req is describing: taking Glean's enterprise context and turning it into something a leader can use without digging through ten dashboards first.

I get to that kind of product by starting with the customer, not the data model. At Sensata I ran 30+ interviews with OEMs and distributors to find where their actual workflow broke down, then turned those findings into roadmap changes that raised CSAT 22% and feature adoption 18% across 50,000+ connected devices. I would rather sit with five users for an hour than guess at a backlog from a spreadsheet.

The cross-functional scoping comes with the territory too. I managed a 100+ feature backlog with Engineering in Agile across 3 regions, and at Applied Materials I build my own Claude AI agents to automate the repetitive side of forecasting, so I already think in terms of what an AI system should own versus what a person should review. For a product area this early, that instinct for where to draw the line matters more than a finished spec.

Enterprise Intelligence is a hard category to define from scratch, and I like that it is still being named rather than templated. Proof trail at adhi-product-ai.vercel.app/ref/glean.
