Hiring Team, OpenAI

Your posting frames pricing governance as a lightweight layer: decision frameworks, approval processes and performance tracking, not a six-month system build. That is exactly what I designed into PriceKeel, a guardrail engine that reads every live discount exception and recommends an explainable limit learned from a company's own closed-won and closed-lost deals, with an audit trail Finance can check line by line instead of chasing a spreadsheet. Whether the lever is seat-based or usage-based, the governance muscle is the same: a rule, an approval path, and a record of what happened.

Before founding it, I ran the Bleeders and Leakers program at Sensata: turned a messy discount and concession dataset into pricing guidance Sales acted on, recovering $700K+ in margin in two quarters and raising channel margins from 53% to 61% in the same stretch. I have also built pricing for a self-serve product from zero. At SwipeHire, an AI job-matching platform, I modeled three subscription tiers directly from competitor benchmarks and willingness-to-pay interviews, then ran the A/B tests that told me which packaging actually converted before onboarding the first users.

Pricing rarely lives inside one function. As Strategic Marketing III at Applied Materials I build competitive, value-based pricing and forecasting models that Sales, Engineering and Accounts all have to agree on before a number goes out, and I have started automating the recurring analysis behind that work with Claude AI agents so the team spends its time on judgment calls, not data pulls. That is the same habit a usage-limit, credit and overage model needs: hold up under ambiguity, get senior stakeholders to agree on one number, and leave behind a framework someone else can run.

I would welcome fifteen minutes to talk through how that pricing-governance habit maps onto usage limits, credits and overages for ChatGPT and Codex. Proof trail at adhi-pricing-ai.vercel.app/ref/openai.
