PITCH DECK | OPENAI PRICING OPERATIONS LEAD

A pricing decision is only as strong as the operating backbone that carries it from approval to launch. I have already built that backbone twice, once inside a multi-$100M BU and once from a blank system.

Built from the CRM, CPQ, and deal-approval stack running PriceKeel today, and the Bleeders and Leakers requirement-intake program that recovered $700K+ in margin in two quarters at Sensata.

- **CRM, CPQ & Deal Approvals** - set up and run end to end at PriceKeel
- **Finance Audit Trail** - evidence-backed review for every pricing exception
- **$700K+ Recovered** - Sensata Bleeders & Leakers requirement-intake program
- **1,200 Opportunities Tracked** - against a $627M target, with sign-off and issue tracking
- **Claude AI Agents** - automating recurring pricing analysis today

WHY THIS DECK EXISTS

Translating pricing strategy into billing, quoting, and revenue-system requirements is a program-management and systems habit. It is not a reporting function, and it does not build itself.

What that actually requires

Turning approved pricing and packaging decisions into business requirements Product, Engineering, Billing, Finance, and GTM can all build against without re-litigating intent.

Managing dependencies, scope tradeoffs, and testing needs across those same teams so a launch date holds.

Standing up lightweight governance (documentation, sign-offs, issue tracking) that scales as pricing complexity grows, instead of a new exception process per launch.

What I have already built at that layer

Set up and run **PriceKeel's CRM, CPQ configuration, and deal approvals** end to end, with an audit trail Finance can check line by line for every exception.

Led **Sensata's Bleeders and Leakers program**: requirement intake through sign-off, recovering $700K+ in margin in two quarters.

Built the **FY2026 tracking dashboard** that prioritized 1,200 pricing opportunities against a $627M target with built-in issue tracking across 3 regions.

> **The through-line: requirement intake, governance, and launch readiness are not a gap to grow into here. They are the system I already run.**

THE MANDATE, MAPPED

What the role covers, and where the proof already sits.

What the role covers

> *Translate pricing strategy, policies, and launch decisions into clear business requirements for billing, quoting, revenue, and related systems teams.*

> *Own pricing-related requirement intake and prioritization, ensuring requests are clear, well managed, and tied to business needs.*

> *Identify recurring friction in pricing execution and drive improvements that reduce ambiguity, delays, and rework.*

My proof

PriceKeel: built the CRM, CPQ configuration, deal approvals, and audit trail from a blank system, the literal operating backbone for pricing implementation.

Sensata Bleeders & Leakers: 1,200 pricing opportunities prioritized against a $627M target, with sign-off and issue tracking built in.

Sensata promotion: rebuilt pricing-execution handoffs end to end, promoted from Product & Growth Marketing to Pricing Lead in 10 months.

THE CLOSED-LOOP PROOF, IN DEPTH

PriceKeel: the operating backbone built from the exception up, not handed a finished policy.

Built as the decision-integrity layer that reads a live discount exception inside the deal platform, the same intake-to-sign-off loop a scalable pricing-operations function runs on.

CRM, CPQ & Deal Approvals

Set Up and Run End to End

The system of record for every pricing decision from approval through launch, built without a finished system to inherit.

Finance Audit Trail

Evidence-Backed Exception Review

Records the human pricing decision with evidence Finance can check line by line, replacing legacy CPQ reporting.

$700K+ Recovered

Sensata Bleeders & Leakers, 2 Quarters

The requirement-intake and sign-off discipline the guardrail engine now automates was built and run by hand first.

The same discipline carries into Applied Materials, where I align Sales, Engineering, and Accounts into one pricing and forecasting framework and automate the recurring analysis with Claude AI agents today.

FIRST 30 DAYS

What the first month inside OpenAI's Pricing & Monetization operations seat would look like.

WEEK 1

Map the current pricing-to-billing handoff

Trace where a pricing decision today loses clarity on its way to a billing or quoting system requirement, the same first step that found $700K in Sensata's Bleeders & Leakers program.

Why first: a governance process built before the handoff is mapped fixes the wrong friction point.

WEEK 2-3

Stand up lightweight governance

Put documentation, sign-offs, and issue tracking around requirement intake, the same discipline that prioritized 1,200 pricing opportunities against a $627M target at Sensata.

Why now: a requirement without a sign-off owner gets reworked, not shipped.

WEEK 4

Turn the launch backlog into one prioritized queue

Translate pending SKU, packaging, and billing-configuration requests into one ranked requirement queue instead of parallel exception threads, the same framework discipline behind PriceKeel's guardrail engine.

Why this fast: a queue built once scales to the next launch without a rebuild.

CLOSE

Pricing operations here needs someone who has already carried a decision from approval through a production system, not just documented the decision. I have.

The core proof is Sensata: the Bleeders and Leakers program recovered **$700K+ in margin in two quarters** by running requirement intake and sign-off end to end across 1,200 pricing opportunities and a $627M target, the same operational discipline this role scales across billing, quoting, and revenue systems.

What is harder to find is someone who has also built the system directly: PriceKeel's CRM, CPQ configuration, deal approvals, and Finance-auditable audit trail, built from a blank system rather than inherited. I bring that same build-and-govern habit to pricing operations here, and I keep building with AI tools today, automating recurring analysis with **Claude agents** at Applied Materials.
