Hiring Team, Bobyard

Your posting asks for a 0-to-1 product shipped with real, quantified customer traction, not adjectives. The closest thing I have is SwipeHire: I wrote the PRD, scoped the MVP and shipped an AI job-matching platform end to end with no handoffs, then ran 8+ A/B tests and 12+ user interviews to turn conflicting early-user feedback into a plan I could defend. It onboarded 50+ users and lifted activation 25%. That is the loop I would bring to your takeoff and estimating bets: thesis, ship, measure, cut what does not work.

I also know what it is like to own a roadmap for workflow-heavy users who do not read documentation before they use software. At Sensata I own the sensor product roadmap and a 100+ feature backlog, and I spent real time with OEMs and distributors, 30+ structured interviews, learning their integration workflow well enough to turn pain points into fixes that lifted CSAT 22% and cut time-to-market 20%. Estimators and GCs are a different trade than OEM engineers, but the job is the same: sit with the workflow until you can defend the plan to the people who build it.

On the automation question, I do not think the answer is "automate everything" or "keep a human on every step," and your posting does not read that way either. At Applied Materials I build AI agents on Claude and I am the one who decides which analysis the agent owns outright and which decision stays with a person, because the two failure modes, an agent that over-trusts a pattern and a human who re-checks work that does not need it, cost different amounts. That is the same call your team is making between computer vision and the estimator's judgment.

I would welcome 15 minutes to walk through how this maps to a specific product area at Bobyard. Proof trail at adhi-product-ai.vercel.app/ref/bobyard.
