Hiring Team, Scale AI

At Sensata I owned a 100+ feature backlog for sensor products and ran it in Agile with an engineering team split across three regions: I tracked the milestones, flagged the dependency risks before they turned into someone else's fire, and that discipline took releases 25% faster and cut time-to-market 20%. That is close to the coordination your posting is asking for: keep the cross-functional pieces of a Senior AI Product Manager's initiative moving so the customer commitment actually ships on schedule.

The customer-facing half of the role is not new either. I ran 30+ structured interviews with OEMs and distributors to pull real requirements out of people who were not going to hand them over cleanly, then turned that into the data-quality signal that reshaped the roadmap and lifted CSAT 22%. I built the same habit into a Power BI dashboard tracking 1,200 pricing opportunities for Sensata leadership, where the job was surfacing the deliverable someone needed before they had to ask twice.

The technical curiosity your posting names is not aspirational for me. I built an AI job-matching platform solo on Python and the OpenAI API, from the PRD through the evaluation loop that decided which matches were good enough to ship, and at Applied Materials I now run AI agents built on Claude against the recurring market analysis that used to eat a day a week by hand. Coding and data pipelines are not adjacent to how I do product work, they are the tools I already reach for.

I would bring that same pattern, coordinate the cross-functional pieces, protect the milestones, keep the data quality honest, to Scale's Coding and Multimodal team. Proof trail at adhi-product-ai.vercel.app/ref/scale-ai.
