Hiring Team, Benchling

At Sensata I owned a 100+ feature backlog for sensor solutions that engineering teams across 3 regions built their sprints against, in Agile, and cutting that backlog down to the right priorities got releases out 25% faster and time-to-market down 20%. That is the same problem I read into your Platform PM opening: a schema and data-model layer that other product teams and AI features build on top of only works if someone is disciplined about what goes in the backlog and why, not just what is technically possible to build.

The backlog work never happened in a vacuum. I ran 30+ structured interviews with OEM and distributor engineers, the technical buyers who had to integrate against whatever we shipped, and those conversations are what told me which schema gaps actually blocked their workflows versus which ones were just noise. I built the KPI frameworks in SQL and GA4 across 50K+ connected devices to check my own assumptions against usage data before I trusted an interview quote. Scientists running experiments on Benchling's platform are a different technical buyer than an industrial OEM, but the discipline of going to the people building on top of your layer before you change it is the same.

I also know what it takes to ship an AI product from nothing. I built SwipeHire, an AI job-matching platform, zero-to-one on Python, OpenAI's API and React: wrote the PRD, scoped the MVP, and onboarded 50+ early users off my own GTM and analytics stack. At Applied Materials now, I automate repetitive analysis with AI agents built on Claude, so I come at "AI platform for biotech R&D" already comfortable with both sides of it, the product surface and the AI tooling underneath.

What I would bring to this role is the habit of treating a shared platform layer as a product with its own roadmap, backlog and customers, not just infrastructure other teams wait on. Proof trail at adhi-product-ai.vercel.app/ref/benchling.
