Hiring Team, Google

At Applied Materials, I size the semiconductor market by pulling live input from Sales, Engineering and Accounts into one forecast that pricing and resourcing decisions actually run on. That is the same motion your Market Intelligence posting describes at a bigger scale: turn scattered technology and competitor signal across the AI value chain into a strategic view a cross-functional set of executives can act on.

At Sensata I benchmarked 10+ competitors across the Industrial BU and turned the findings into a recommendation that drove +12% YoY revenue and +8% market share, then carried that same analysis directly into AP26 revenue models and site-transition strategy with senior executives. Primary research is where I start, not where I end up: 30+ customer and OEM interviews at Sensata, and a 5-consultant market-entry study at Safran that turned 170 facilities across four verticals into a defensible SAM of 28 for a leadership readout.

My opinion on strategy work at this scale is that a forecast only holds up if the model behind it survives a follow-up question, which is why I write my own SQL and Python against the underlying dataset instead of taking someone else's chart on faith. I automate the recurring parts of that analysis with AI agents built on Claude at Applied Materials today, and I want to bring that same discipline, turning technological trends into financial forecasting assumptions, to a team advising Google's product strategy, partnerships and M&A decisions across the AI and semiconductor markets.
