Hiring Team, Micron Technology

Your posting describes a job I am already doing one layer up the supply chain. At Sensata I built the FY2026 Bleeders and Leakers Power BI dashboard: 1,200 pricing opportunities tracked against a $627M target across 3 regions and 20 product lines, surfacing $433M in margin gaps for leadership to prioritize. That is the same discipline this role needs for cost, capacity and demand data: turn a pile of numbers into one model people trust enough to act on.

Right now, at Applied Materials, I size the semiconductor market itself, working with Sales, Engineering and Accounts to build top-down and bottom-up demand models and forecast where the market inflects next. I keep those models current the way your team keeps TAM data accurate, and I automate the recurring parts of that analysis with AI agents built on Claude rather than rebuilding the same report by hand every cycle, which is the same use of AI for business analytics your posting calls out.

Presenting competitor data to management is not new territory either. At Sensata I benchmarked 10+ competitors to realign pricing, helping drive +12% YoY revenue and +8% market share, and I partnered directly with senior executives on AP26 revenue models and ad hoc analyses when a deal or a market shift needed an answer fast. Earlier, as a Sensata intern, I built the first version of that habit: breaking down the top three competitors' products and positioning and turning POS and market data into distribution recommendations.

Micron sits inside the same industry I already model every day, with a market model that moves faster and matters more broadly across the business. I would bring someone who has already built the dashboard, run the benchmarking and presented the number to leadership, not someone learning the format on the job.
