PITCH DECK | MICRON TECHNOLOGY MARKET INTELLIGENCE MANAGER

Micron's market model needs to turn TrendForce, IDC and IHS data, plus its own demand signals, into one number corporate teams and business units can act on, fast. I already run that exact discipline one layer up the supply chain.

Demand market models, competitive benchmarking and AI-assisted analysis from inside the semiconductor industry, not adjacent to it.

- **$433M** in margin gaps surfaced for leadership, Sensata FY2026 dashboard
- **10+ competitors** benchmarked, +12% YoY revenue and +8% market share
- **Top-down/bottom-up demand models** built today at Applied Materials
- **AI agents built on Claude** automating recurring business analytics
- **170 facilities to SAM of 28**, Safran market-sizing project

WHY THIS DECK EXISTS

The hard part of this seat is not building one market model. It is keeping top-down and bottom-up demand models, analyst-report synthesis and TAM accuracy all moving together while supply, demand and cost/capacity shift under them every quarter.

What this seat actually requires

Maintaining demand market models top-down and bottom-up, and reading analyst reports and other market data for trends before they show up as surprises.

Keeping TAM data accurate enough that corporate teams and business units trust the number without re-checking it themselves.

Presenting competitor data to management and turning around executive ad hoc analyses on short notice, using AI for business analytics along the way.

What I have already run

At **Applied Materials**, I build the top-down and bottom-up demand models for a fast-growing semiconductor market today, the same model-maintenance discipline this seat owns.

At **Sensata**, I built a BU-wide Power BI system tracking 1,200 pricing opportunities against a $627M target across 3 regions and 20 product lines, the same market-data-to-one-number discipline TAM accuracy requires.

I automate my own recurring analysis with **AI agents built on Claude** at Applied Materials, the same use of AI for business analytics this posting asks for.

The through-line: every market model I have touched started as scattered data from the field, analyst sources or competitors, and ended as one number a business team could act on without re-deriving it.

THE MANDATE, MAPPED

What the posting asks for, and where the proof already sits.

What the role covers

> *"Maintains demand market models (top-down and bottom-up)... analyzes analyst reports and other market data for trends."*

> *"Provides market insights to corporate teams and business units... ensures TAM data accuracy."*

> *"Uses AI for business analytics and data analysis... presents competitor data to management and supports executive ad hoc analyses."*

My proof

Top-down/bottom-up demand models: build market-sizing and forecasting models across multiple product groups at Applied Materials, forecasting demand inflection points for the semiconductor market.

Market data to one trusted number: built the FY2026 Power BI dashboard surfacing $433M in margin gaps across 1,200 opportunities and 20 product lines for leadership to prioritize.

Competitor data to management: benchmarked 10+ competitors to realign pricing, driving +12% YoY revenue and +8% market share, and partnered with senior executives on AP26 revenue models and ad hoc analyses.

AI for business analytics: automate recurring market-research and reporting work with AI agents built on Claude at Applied Materials.

THE SENSATA PROOF, IN DEPTH

Bleeders and Leakers: find the gap in the data, build the model, give leadership one number to act on.

Built as a BU-wide Power BI system covering 1,200 pricing opportunities against a $627M target across 3 regions, 4 product families and 20 product lines, with pipeline funnel, win rate and stage distribution by product line, so leadership could prioritize instead of chasing anecdotes from the field.

$433M

Margin Gap Surfaced

Ranked every opportunity by competitive gap and market data, the same data-to-decision triage a market model has to run continuously.

10+

Competitors Benchmarked

Drove +12% YoY revenue and +8% market share through price realignment built on that competitive data, then presented to management.

20

Product Lines Tracked

Across 3 regions and 4 product families, the same breadth a corporate-level market model has to hold at once.

The same program fed AP26 revenue models and executive ad hoc analyses with senior leaders. The common thread: every model was built on data, checked for accuracy, and handed to a business team as a decision, not a spreadsheet.

FIRST 30 DAYS

What the first month inside Micron's CDBU market intelligence function looks like.

WEEK 1

Learn the demand model and the data feeding it

Sit with the demand market model, the analyst-report workflow and the business units that consume it, to see where today's model already earns trust and where TAM accuracy needs tightening first.

Why first: the same discovery step that started the Bleeders and Leakers program at Sensata.

WEEK 2-3

Ship the first competitor and trend read to management

Pull competitor and analyst data into a first read for management, benchmarked the way I ran 10+ competitors at Sensata, and pressure-test it with the business units who will act on it.

Why now: the same competitor-to-management habit that helped drive +8% market share at Sensata.

WEEK 4

Bring an AI workflow into the recurring analysis

Automate the recurring parts of market-data synthesis with an AI agent, the way I already do at Applied Materials, so the next executive ad hoc request starts from a model that is already current.

Why this fast: the same AI-agent habit keeping my own reporting current today, not a plan for someday.

CLOSE

You are hiring someone to turn demand models, analyst data and competitor intelligence into one number the business can act on. I already run that model, one industry layer up.

The model half: top-down and bottom-up demand models and forecasting across multiple product groups at **Applied Materials**, today, in the same semiconductor industry.

The proof half: **$433M** in margin gaps surfaced from a 20-product-line Power BI system at Sensata, **10+ competitors** benchmarked into a pricing realignment that drove +12% YoY revenue and +8% market share, and a 170-facility **TAM/SAM/SOM** study presented to Safran's leadership.
