PITCH DECK | EARNIN SENIOR STRATEGY & OPERATIONS MANAGER

A pilot that only one person can run is not an agentic workflow, it is a manual process with better branding. I build the kind that survives the handoff.

0-1 strategy and operations work, built to turn into a playbook, with AI agents already doing the recurring part of mine.

- **$627M** pricing-opportunity target tracked live in a Power BI dashboard I built at Sensata, from scratch
- **$433M** in margin gaps surfaced from that dashboard for leadership to act on
- **$700K+** recovered in 2 quarters once the program ran without me re-explaining it each cycle
- **Claude AI agents** already automate the recurring part of my own forecasting work, at Applied Materials
- **8-client, $15K-$90K/mo** account book run end to end with a small, hired-and-managed team

WHY THIS DECK EXISTS

Calling something "agentic" does not make it durable. The question is who keeps it running after the first owner moves on.

What a GM-style B2B strategy seat runs into

A 0-1 bet gets scoped, piloted, and proven once, then the next team inherits a process that only worked because one person remembered every exception.

"Why isn't an agent doing this" is the right question to ask, but asking it does not replace the work of mapping which manual steps are actually safe to automate first.

The fix is not another pilot. It is an operator who ships the first version, writes the playbook, and makes the handoff boring on purpose.

What I have already run, hands on

At **Sensata**, I took the Bleeders and Leakers program from an ad-hoc negotiation habit to a repeatable process: a dashboard, a cadence, and a playbook other regions could run without me in the room.

At **Applied Materials**, I automate the recurring part of my own forecasting and market-sizing work with AI agents built on Claude, so the agent does the refresh and I do the judgment call.

At **Pixis**, I hired and ran a small team against an 8-client book with real P&L ownership, the same small cross-functional scope this role describes.

Incubate 0-1 bets, replace manual B2B GTM steps with agentic workflows, and turn pilots into playbooks other teams can run: this is the exact loop I already operate.

THE REQ, MAPPED

What the Senior Strategy and Operations opening asks for, and where the proof sits.

What the role covers

> *"Operate like an early general manager: understanding business economics, defining strategy, and breaking big goals into work that gets done."*

> *"Identify where manual work in B2B go-to-market, adoption, and account operations can be replaced with agentic workflows."*

> *"Take AI pilots from experiment to production by turning what works into playbooks, templates, and reference implementations."*

> *"Partner with business development, sales, and account management to create pitch decks and sales content."*

My Proof

Sensata Bleeders and Leakers program: built the dashboard, the cadence and the playbook myself, end to end, P&L and revenue targets attached.

Applied Materials automation: AI agents built on Claude already run the recurring part of my forecasting and market-sizing work, reviewed, not just deployed.

Pilot to playbook, twice over: the Sensata program and SwipeHire (a job-matching platform I built zero-to-one) both shipped a repeatable process, not a one-off.

Pitch decks that moved money: shaped AP26 revenue models and multimillion-dollar customer quotes with senior executives, decks included.

THE SENSATA PROOF, IN DEPTH

One program, built once, that other regions could run without me re-explaining it every cycle.

The Bleeders and Leakers program started as ad-hoc negotiations on margin-losing deals. I turned it into a repeatable process: a Power BI dashboard tracking 1,200 pricing opportunities against a $627M target across 3 regions, 4 product families and 20 product lines, with its own pipeline funnel, win-rate and stage-distribution views built in so the next region did not need me to interpret the data.

$627M

Target Tracked, Repeatably

1,200 pricing opportunities across 3 regions, 4 product families and 20 product lines, running on a cadence other regions could pick up.

$433M

Margin Gaps Surfaced

Flagged for leadership to prioritize by salesperson and product line, the same risk-flagging a 0-1 B2B bet needs before it scales.

$700K+

Margin Recovered in 2 Quarters

The payoff once the process ran on its own cadence, not a one-time win that needed me in every deal.

The common thread: build the first version myself, make the second version boring enough that someone else can run it, then act on what it finds. That is what I would bring to EarnIn's B2B initiatives.

HOW A 0-1 BET GETS TO PLAYBOOK, ON A REALISTIC CLOCK

Your posting describes experiment, production, and playbook as three separate steps. Here is how I would run each one.

FIRST STRETCH

Pick the highest-leverage manual step, ship a working pilot

Partner with the GMs to find the single manual B2B step costing the most hours, ship a first working version with engineering, and define the metric that proves it is worth scaling.

Why this is realistic: it is the same opening move behind the Sensata dashboard: find the highest-leakage spot before building anything.

SECOND STRETCH

Take the pilot to production, write the playbook

Harden the pilot with engineering so it runs safely and durably in production, then write the playbook and templates so a second team can run it without me in the room.

Why now: the same automate-then-document sequence that lets Claude agents run my recurring analysis at Applied Materials today.

THIRD STRETCH

Make the win visible, make the next bet fundable

Establish the performance metrics leadership will trust, build the pitch deck and business case, and use that proof to win budget and backing for the next 0-1 bet.

Why this sticks: the same trust the Bleeders and Leakers program earned once it recovered $700K+ instead of just reporting a number.

CLOSE

You are hiring someone to operate like an early GM and replace manual work with agentic workflows that run in production. I already do both, today.

The core proof is Sensata: a program I took from ad-hoc negotiation to a repeatable process tracking a **$627M target**, surfacing **$433M in margin gaps**, and recovering **$700K+ in two quarters** once it ran on its own.

What is harder to find is someone who already automates the recurring part of that work with the same AI agents your posting names. I run that today at Applied Materials with agents built on Claude, which means the habit this role asks for would not need to be built from zero.
