Hiring Team, Anthropic

Your posting asks for someone who can turn effective heroics into a repeatable, scaled methodology. That is the exact arc of Sensata's Bleeders and Leakers program: it started as a one-quarter pricing push, and I turned it into a standing Power BI system that tracks 1,200 opportunities across 3 regions, 4 product families and 20 product lines against a $627M target, with win rate, average dollar-per-win and stage broken out by salesperson. It surfaced $433M in margin gaps, and running it as a weekly review cadence recovered $700K plus in two quarters and raised distributor margins from 53% to 61%. That is what a program looks like once it outlives the person who built it, the same bar your posting sets for an NPI methodology.

I have also sat on the side of the readout that writes it for executives, not the side that hands it off to be interpreted. I shaped AP26 revenue models and multimillion-dollar customer quotes directly with Sensata's senior leadership, and at Applied Materials I partner with Sales, Engineering and Accounts to turn technical and field input from three different teams into one forecast leadership can act on. That cross-functional synthesis, pulling one read together from several teams' views rather than handing over one team's slice of it, is close to what your posting asks a launch program to do between Product, Research, Finance and GTM leadership.

I already point an AI agent at the recurring part of that analysis. At Applied Materials I automate forecasting and sizing busywork with agents built on Claude, which is the same extreme-ownership instinct your posting describes, aimed at a GTM problem instead of described in the abstract. Right now I am also running the CRM, forecast reviews and deal approvals end to end at PriceKeel, the company I founded, so I know what it costs to own a number with no analyst layer underneath it, inside a product that is still changing shape under you.

The field response loop your posting describes, routing AE, CS and Applied AI signal to the teams that can act on it, is the same discipline I ran at Sensata turning 30+ OEM and distributor interviews into product and GTM recommendations, and at Pixis feeding voice-of-customer signal back to product across an 8-client portfolio.
