

PITCH DECK | CANDID HEALTH PRODUCT MARKETING MANAGER

A revenue-cycle platform scaling this fast needs a product marketing function built from scratch, not tuned from an existing one. I have already built that function twice.

A launch-plan-to-case-study track record built on a \$2M+ zero-to-one GTM and a 50+-rep enablement library, paired with the regulated-buyer instinct that transfers directly from aerospace and automotive compliance work.

Built the function from zero - Sensata GTM end to end, \$2M+ first-year revenue

30+ interviews - became case studies, references and roadmap input, CSAT +22%

50+ reps enabled - sales enablement library, win rates +30%

Healthcare-vertical persona work - Safran project, 4 verticals including healthcare

AI agents on Claude - in production use today, Applied Materials

A first product marketing hire at a fast-growing RCM platform cannot spend a quarter learning the function. **The launch plans, campaigns and enablement have to exist from day one.**

What that actually requires

Launch plans that cross functions cleanly, so positioning, pricing, packaging and demand generation move on the same clock instead of in sequence.

Sales enablement and customer case studies built from real customer conversations, not a messaging doc written from a feature list.

Feature launches coordinated against a live roadmap, so the field never finds out about a launch the same week a customer does.

What I have already built at that exact seam

Built a **go-to-market function from zero** at Sensata (positioning, pricing, channel, launch) with no existing motion to inherit, closing the first year at \$2M+ in revenue.

Converted **30+ structured customer interviews** into case studies, references and roadmap input, raising CSAT 22%.

Coordinated **feature launches** against a 100+ item backlog in Agile across 3 regions, shipping releases 25% faster.

The through-line: I have already run the build-the-function-from-scratch mandate this role carries, on a technical product where a launch could not wait for the function to mature first.

What the Candid Health posting asks for, and where the proof already sits.

What the role covers

- "Partner across functions to develop launch plans" and "execute integrated marketing campaigns."*
- "Build the product marketing function from scratch" and "coordinate feature launches."*
- "Create sales enablement materials" and "convert customer success stories into case studies."*

My proof

- Launch plans that moved every lever together:** positioning, pricing, channel and launch owned end to end to \$2M+ in first-year revenue, with integrated email and paid campaigns generating 35% more qualified leads.
- A function built with no handoff to lean on:** the same zero-to-one mandate this posting names, run once already at Sensata and again right now founding PriceKeel's own GTM.
- Feature launches coordinated, not just announced:** a 100+ item backlog managed in Agile across 3 regions, accelerating releases 25%.
- Case studies built from real customer conversations:** 30+ structured interviews turned into references and case studies that enabled 50+ reps, win rates +30%.

Sensata: a launch-to-case-study loop built as the function's first owner, not inherited from someone else's playbook.

Built as the owner of positioning, launch plans and the sales enablement library for a new sensing line, the same scope this role names for Candid Health's platform.

\$2M+ / 35%

First-Year Revenue / Qualified-Lead Lift

The launch result and the integrated campaign that fed it, run across email and paid channels.

30+ / 22%

Customer Interviews / CSAT Lift

OEM and distributor conversations converted into case studies, references and roadmap input.

50+ / 30%

Reps Enabled / Win-Rate Lift

A sales enablement library built off that same research, actually pulled up mid-deal.

The regulated-buyer instinct behind it comes from automotive and aerospace compliance work at Sensata and a graduate persona build across 4 verticals including healthcare, the closest honest parallel to how a health-plan or provider buyer evaluates a claim.

What the first month building Candid Health's product marketing function would look like.

WEEK 1

Sit with Sales and Customer Success, not a blank positioning doc

Pull the last quarter's won and lost competitive deals and the customer-success stories already sitting in CRM notes, the same move that grounded the Sensata launch plan in real signal instead of a guess.

Why first: a product marketing function built on assumptions is the fastest way to lose the field's trust before it ships anything.

WEEK 2-3

Ship the first case study and the first launch plan

Convert the strongest customer success story into a case study sales can use this quarter, and draft the launch plan for the next feature already on the roadmap, benchmarked the same way the Sensata launch was.

Why now: one case study and one launch plan actually in use beat a full playbook nobody has opened yet.

WEEK 4

Turn the first win into the repeatable cadence

Set the cross-functional cadence (Sales, Product, Customer Success) that keeps launch plans, enablement and case studies current as the platform ships, so the function does not go quiet after its first launch.

Why this fast: a function built from scratch only earns its headcount by proving it moved a launch first.

CLOSE

Candid Health needs a product marketing function built from scratch: launch plans, campaigns, enablement and case studies, all at once. I have already built that exact function twice.

The core proof is Sensata: a **go-to-market function built from zero** to \$2M+ in first-year revenue, with a sales enablement library built off 30+ real customer interviews that enabled 50+ reps to a 30% win-rate lift.

The regulated-buyer instinct behind that work came from aerospace and automotive compliance, plus a healthcare-vertical persona build, the closest parallel to how a health-plan or provider buyer evaluates a claim. What transfers immediately is the mechanics this role is built around: launch plan to campaign to enablement to case study, on a repeatable cadence.
