Hiring Team, Tint

Before I ever wrote a line for Sensata's roadmap, I built the dashboard that told us where the numbers were wrong. The FY2026 Bleeders and Leakers model tracked 1,200 pricing opportunities against a \$627M target across 3 regions, and its whole job was to catch anomalies, gaps between what a deal should have cost and what it actually did, before they reached a customer quote. That is the instinct I recognized in your posting: someone who watches the data for what breaks, writes it down, and gets it fixed before it becomes a support ticket.

I have spent the last two years living in that loop. At Sensata I owned a 100+ feature backlog and roadmap for sensor solutions, working with engineering in Agile across 3 regions, and I did not sign off on a release until it matched the acceptance criteria we had agreed on, which is part of why time-to-market came down 20%. I built KPI frameworks in SQL and GA4 across 50K+ connected devices specifically to flag adoption anomalies and cohort drop-off early, then ran 30+ interviews with the OEMs and distributors who actually touched the product to confirm what the data was telling me. Documentation was not an afterthought in any of that; the changelog and the competitive-analysis notes I kept were what let other regional teams reuse the work instead of re-litigating it.

I also know what it is to be the only person watching a young product for something to go wrong. I built SwipeHire, an AI job-matching platform, from a blank page: wrote the PRD, defined the QA acceptance criteria myself, and shipped it to 50+ early users while running the analytics stack (GA4, event tracking) that caught issues before users had to report them. Embedded insurance has more moving parts than a job board, but the discipline is the same one Tint's largest program needs: someone who will live inside the monitoring and ticketing tools day to day, triage what ops flags, and keep the documentation current enough that the next person does not have to guess.

I would welcome a conversation about where I could plug into the program fastest. Proof trail at adhi-product-ai.vercel.app/ref/tint.
