Hiring Team, Glean

Your posting says the PM locks the API contract before engineering starts building. At Sensata I ran the same discipline on a 100+ feature backlog: I did not let a sprint open until the integration spec was agreed with Engineering, and running that way across 3 regions got releases out 25% faster and cut time-to-market 20%. That is the habit this role is really testing for, and it is already how I work.

The posting also asks for someone who treats support patterns as design problems, not tickets. I built that muscle interviewing 30+ OEM and distributor engineers at Sensata to find exactly where their integrations broke before a ticket ever got filed, then shipped fixes that raised CSAT 22% and feature adoption 18% across 50,000+ connected devices. I have done the same thing on the systems side: I owned the Salesforce, Adobe Analytics, GA and Google Tag Manager integration stack at Plug Power end to end, so I know what a flaky webhook or an inconsistent error contract costs the team downstream.

I also do the translation work well: turning a technical spec into documentation and positioning a partner can act on without opening a ticket, the way I rewrote Sensata's sensor specs into materials that lifted conversion 15% on priority launches. At Applied Materials I build my own Claude AI agents to cut the repetitive work out of forecasting, so I show up already thinking in automation and interfaces, not just roadmaps.

I would like to talk about what time-to-first-call and integration success rate should look like for Glean's developer base. Proof trail at adhi-product-ai.vercel.app/ref/glean.
