Hiring Team, Google

The price-increase model I built at Sensata flagged line items where a configurable change could lift profitability more than 50%, and it drove a 12% YoY revenue gain inside two quarters. That is the same question your Bidding team asks of its own optimization layer: where is the next pocket of advertiser value hiding inside a system that already runs at scale.

I have also run the other half of that work, turning a PRD into a shipped roadmap with engineering. At Sensata I carried a 100+ feature backlog through PRDs with Engineering in Agile across three regions, and I ran paid-search bid optimization across Google Ads, Microsoft Ads and Meta that cut CPA 25%, the advertiser-side version of the budget pacing and auction work your posting describes. I also spent two years managing an AI ad-optimization portfolio at Pixis, where smart bidding and full-funnel restructuring delivered 3x ROAS in a single month for one client.

Right now at Applied Materials I automate repetitive forecasting and market-sizing work with AI agents built on Claude, so the hours go to the judgment calls instead of the spreadsheet. That is the same instinct your posting asks for: building a generative AI tool into the workflow instead of working around it, which is exactly where Gemini sits inside the bidding products your team is shipping.

I would like to bring that combination, a pricing model that finds new value and a PRD that actually ships, to the team building the next generation of bidding products at Google.
