

Your Bidding team's next advertiser-value gain is probably hiding inside a system that already runs at scale, not a feature that is not built yet. I have found that exact kind of gap before, with the numbers to show for it.

A configurable price-increase system that found 50%+ margin lifts, a bid-optimization program that cut CPA 25%, and a PRD-to-roadmap habit that ships with engineering.

50%+ profitability lift flagged by a BU-wide price-optimization system

-25% CPA from Google Ads and Microsoft Ads bid optimization

3x ROAS in one month from a smart-bidding, full-funnel rebuild

100+ feature backlog shipped through PRDs with Engineering

AI agents on Claude built into my own workflow today

The job is not "ship a bidding feature." It is finding where an **advertiser-value gap** is hiding inside Search and Shopping Bidding systems that already run at scale.

What that actually requires

An opportunity-sizing model that finds value inside a system advertisers of every size and sophistication already depend on, not a template analysis.

A PRD-to-OKR motion that turns a new bid strategy into something partner engineering, PgM and UX teams can actually build and launch.

A generative AI habit already built into the daily workflow, not bolted on for this one req.

What I have already run

At **Sensata**, I modeled a BU-wide price-optimization system that flagged where a configurable change could lift profitability more than 50%, and used it to drive a 12% YoY revenue gain.

At **Plug Power**, I led the bid optimization behind Paid Search and Paid Social across Google Ads, Microsoft Ads, Meta and LinkedIn, running 15+ A/B tests that cut CPA 25%.

At **Applied Materials** today, I automate repetitive forecasting work with AI agents built on Claude, the same generative-AI-into-workflow habit the role asks for.

The through-line: every bid or price change I have shipped had the value-sizing model built first and the roadmap behind it, not a feature guessed into the backlog.

What the posting asks for, and where the proof already sits.

What the role covers

- "Develop new bidding approaches to drive more advertiser value across existing and future bidding strategies."*
- "Analyze the ads system to find new areas of opportunity for both advertiser-facing and backend algorithm product improvements."*
- "Experience integrating generative AI tools or LLM interfaces into workflows."*

My proof

- Sensata, opportunity-sizing model:** built a Power BI price-increase system across 3 regions and 20 product lines that flagged profitability gaps competitive benchmarking alone had missed.
- Plug Power, advertiser-side bidding:** ran bid strategy and budget pacing across Google Ads, SA360 and Meta for \$100K/month budgets, cutting CPA 25% through 15+ A/B tests.
- Pixis, smart bidding at scale:** managed an 8-client AI ad-optimization portfolio and delivered 3x ROAS in one month through a full-funnel, smart-bidding rebuild.
- SwipeHire, LLM integration:** built an AI job-matching platform end to end, wiring an LLM interface directly into the matching and resume-tailoring workflow for 50+ users.

Find the value gap, model it, then ship the roadmap engineering can build against.

The same three-step pattern, applied twice on the advertiser side and once on the margin side: size where value is hiding inside a system that already works, build the model that quantifies it, then carry it through PRDs with engineering instead of leaving it as a recommendation.

50%+ Flagged

Price-Optimization System, Sensata

A BU-wide Power BI model flagging line items where a configurable change could lift profitability more than 50%, driving a 12% YoY revenue gain.

-25% CPA

Bid Optimization, Plug Power

15+ A/B tests across Google Ads, Microsoft Ads, Meta and LinkedIn against \$100K/month budgets, the advertiser-side version of the auction work bidding teams ship.

3x ROAS

Smart Bidding Rebuild, Pixis

One month, one fashion-brand client, full-funnel restructuring: feed cleanup, smart bidding, creative refresh and lookalike expansion.

None of this sat in a slide deck. Each case closed the loop from a sized opportunity to a number the business signed off on.

What the first month on Google's Bidding team looks like.

WEEK 1

Map where the current bidding system leaves value on the table

Pull existing advertiser segments by size, vertical and sophistication, and find where bid strategies already underperform budget pacing or targeting for a specific segment.

Why first: the same first move behind the Sensata price-optimization system, find the gap before building a new model to close it.

WEEK 2-3

Build the opportunity model for one bidding path

Pick the highest-ambiguity bid strategy question, a budget-pacing edge case or an auction segment underserved today, and build the quantitative case with Engineering and Google Research.

Why now: the same cross-functional build behind the Sensata and Plug Power bid-optimization programs, not a solo analysis.

WEEK 4

Turn the model into a PRD and OKRs partner teams can build against

Translate the sized opportunity into a PRD, then into OKRs for the engineering and PgM teams who will ship the new bid strategy or backend improvement.

Why this fast: the same PRD-to-OKR habit that carried a 100+ feature backlog through Engineering at Sensata.

CLOSE

You are hiring someone to find the next advertiser-value gap inside a bidding system that already runs at scale, then ship the roadmap behind it. I have run that exact pattern three times, on three different systems.

The value-sizing half: a [price-optimization system flagging 50%+ profitability gaps](#) at Sensata and a [bid-optimization program cutting CPA 25%](#) at Plug Power, both built before the business asked for them.

The shipping half: a [100+ feature backlog carried through PRDs](#) with Engineering in Agile, and a generative AI habit, AI agents built on Claude, already wired into how I work today.
