Hiring Team, Fivetran

Your posting asks for someone who can turn performance data into a defensible investment call, then hold that call in front of a VP. I already built the model that does that: at Sensata I ranked 1,200 pricing opportunities against a \$627M target across 3 regions and 20 product lines in a Power BI dashboard I designed myself, then used it to recover over \$700K in margin in two quarters. The structure is the same one your target-setting and budget-allocation work asks for, just applied to pricing instead of channel mix.

The channel-level ROI side is not theoretical for me either. At Pixis I ran paid media for 8 clients on \$15K to \$90K monthly budgets each, read blended ROAS against holdout tests to catch channels that were quietly over-credited, and used the fix to deliver 3x ROAS for one brand the following month. At Plug Power I owned \$100K/month budgets across multiple business units, cut cost per lead in half by automating the lead flow from WordPress into Pardot, and tied SEM spend to MQL quality and stage 1 opportunities instead of raw lead counts. That is the same cost-per-lead and marketing-efficiency math this role runs, built in Power BI and Tableau with the same instinct for which assumptions in a coverage model need to be questioned first.

I like that Fivetran and dbt Labs are mid-integration right now, because the planning model and ICP alignment this role owns are still being written rather than maintained from an old playbook. I already automate the repetitive side of forecasting and revenue analysis with Claude AI agents in my current role at Applied Materials, which is exactly the kind of leverage a team redefining its own targets and operating model needs more of, not less.

I would like to bring that planning discipline to Fivetran's Growth marketing org. Proof trail at adhi-growth-ai.vercel.app/ref/fivetran.
