Hiring Team, LinkedIn

I built an AI job-search platform for job seekers from a blank page: auto-tailored resumes, visa-aware matching, the onboarding flow, all of it. Fifty-plus early users ran real job searches through it, and I was the one deciding what the positioning said, who the ICP was and which pricing tier made sense, because there was no one else to hand any of it to. That is close to the exact mandate in your posting: understand what a job seeker actually needs, then turn it into a narrative and a product decision in the same breath.

At Sensata I ran the other half of that loop at a bigger scale. Thirty-plus structured interviews with OEMs and distributors fed straight into the next product roadmap, not just a positioning deck, and the launch built on that research brought in $2M+ in first-year revenue. I also own the roadmap conversation directly: I defined and executed it for an entire sensor line, managing a 100+ item backlog with engineering across three regions and cutting time-to-market 20%.

Competitive intelligence is not new either. A 10+ player benchmark I built fed a pricing decision that moved an entire business line, and I have presented customer research and revenue models straight to senior executives, the same audience-to-strategy translation your posting describes across Product, Design, Research and Communications. None of it sat in a folder; each one closed the loop back to a number the business was accountable for.

At Applied Materials today I automate the repetitive side of my own market analysis with AI agents built on Claude, so more of the week goes to the research and narrative work a job seeker audience role actually needs. The SwipeHire case study and the rest of the proof trail are at adhi-product-ai.vercel.app/ref/linkedin.
