PITCH DECK | CISCO PRICING AND STRATEGY SR. ANALYST

Price elasticity and willingness to pay already paid for themselves once. Here is the receipt, and where I would point that lens at your security portfolio.

Pricing strategy, monetization and discount governance from someone who builds the pricing tool on the side.

- **$700K+** margin recovered in 2 quarters via elasticity and WTP-driven negotiation
- **53% to 61%** distributor margin lift from repriced pricing logic
- **1,200** pricing opportunities ranked against a $627M target, 3 regions
- **PriceKeel** - founder, subscription/consumption deal-pricing product
- **+12% YoY revenue, +8% share** via global price realignment vs. 10+ players

WHY THIS DECK EXISTS

A security portfolio this size does not have a pricing-data problem. It has a willingness-to-pay problem.

What a portfolio like this runs into

Hardware, software and services sold across multiple licensing and consumption models mean elasticity looks different in every segment, and a single discount KPI dashboard cannot say why.

Annual pricing reviews surface the symptom (margin drift, a discount creeping up) without always surfacing the underlying willingness-to-pay or competitive shift that caused it.

The fix is not another chart. It is a repeatable way to test elasticity, read the competitive and market signal, and turn both into pricing logic the team can defend.

What I have already run, at smaller scale

At **Sensata**, I ran the Bleeders and Leakers program: willingness-to-pay and competitive-gap data ranked against a hard revenue target, by region and product line.

I tested and refined the underlying pricing logic itself, which is why the **53% to 61%** distributor gain held past the first quarter instead of drifting back.

I am now building **PriceKeel**, a subscription and consumption deal-pricing product, so I have run the elasticity exercise on both a hardware BU and a SaaS pricing model.

Support pricing and monetization strategy, analyze buyer behavior and willingness to pay, build scalable pricing tools, monitor discount KPIs. That is the same loop I ran at Sensata, just applied to a smaller portfolio than Cisco's.

THE REQ, MAPPED

What the Pricing Strategy and Monetization team asks for, and where the proof sits.

What the role covers

> *"Analyze buyer behavior, price elasticity, and willingness to pay."*

> *"Help build scalable pricing tools" and "monitor pricing/discount KPIs."*

> *Preferred: subscription, consumption and licensing models; AI/ML-driven pricing; global pricing exposure.*

My Proof

Bleeders and Leakers program at Sensata: built the Power BI tool, ranked 1,200 opportunities against a $627M target, then closed $700K+ of it on elasticity and WTP data in 2 quarters.

Scalable pricing tool, built once and reused: a BU-wide price-increase model flagging where a change lifts profitability more than 50%, run across 3 regions and 20 product lines.

Subscription and licensing analog: PriceKeel's CRM/CPQ and deal-approval workflow is the consumption-pricing muscle a hardware-only background would not otherwise have.

AI/ML-driven pricing, already in motion: automate recurring pricing analysis with AI agents built on Claude at Applied Materials today.

THE SENSATA PROOF, IN DEPTH

Bleeders and Leakers: elasticity data in, defensible pricing logic out.

A BU-wide Power BI system covering 1,200 pricing opportunities against a $627M target across 3 regions, 4 product families and 20 product lines, with pipeline funnel, win rate and discount KPIs reported to leadership weekly.

$433M

Margin Gaps Surfaced

Every opportunity ranked by the willingness-to-pay and competitive-gap signal behind it, not by anecdote, so leadership could prioritize by salesperson and product line.

$700K+

Margin Recovered in 2 Quarters

Closed through negotiations built on documented elasticity and willingness-to-pay data, not an across-the-board price increase.

53% to 61%

Distributor Margin Lift

Came from testing and refining the channel pricing logic itself, the same "test and refine pricing logic" ask in this posting.

The same cycle also produced AP26 revenue models and multimillion-dollar customer quotes presented to senior executives, plus a global pricing mandate across multiple product lines and regions, the executive-presentation and global-pricing-exposure preferences this posting names directly.

FIRST 30 DAYS

What the first month on this pricing desk looks like.

WEEK 1

Read the elasticity signal

Pull the last pricing review's discount KPIs and competitive data by product line and licensing model. Sit with the pricing and finance teams to find where willingness-to-pay data is thin or contradicts the current discount guardrails.

Why first: the same move that opened the Bleeders and Leakers program: find where the data is quiet before proposing a fix.

WEEK 2-3

Build and test the pricing tool

Build or extend a scalable pricing model that ranks opportunities against the elasticity and competitive data, then test one pricing-logic change against a single product line before scaling it.

Why now: ranking against a hard signal, then testing before scaling, is what made the 53% to 61% distributor gain hold.

WEEK 4

Ship the KPI view

Turn the test into a discount KPI view the team monitors on a recurring cadence, with the elasticity and willingness-to-pay logic documented well enough to survive the next annual pricing review.

Why this fast: a pricing tool only earns its name if it gets monitored after the first win, not just built once.

CLOSE

You are hiring someone to read elasticity and willingness to pay, then make pricing logic that holds. I have already run that loop, at meaningful scale.

The core proof is Sensata: **$700K+ in margin recovered in 2 quarters** on elasticity and willingness-to-pay data, distributor margins lifted **from 53% to 61%** through repriced logic, and **+12% YoY revenue with +8% market share** from a global price realignment against 10+ competitors.

What is harder to find is someone who has run that same exercise on a subscription and consumption pricing model, not just hardware. **PriceKeel is that second data point**, and the AI/ML-driven pricing habit (Claude agents at Applied Materials) is already part of how I work, not something to pick up on the job.
