Hiring Team, Nscale

Your posting describes the hardest part of this job in one line: turning complex technical capabilities into customer-facing narratives, content, and enablement that support pipeline growth. I have run that exact translation at Sensata, where I owned positioning, messaging and launch execution for new sensing products across North America and Europe and turned deep technical specs into buyer-ready stories that drove \$2M+ in first-year revenue. The products were different, but the job was the same one you are hiring for: take what Engineering built and make it legible to a buyer who did not build it.

Sales enablement is where I spend most of my time, not an afterthought after the launch ships. I built the decks, case studies and talk tracks that armed 50+ Sensata reps and moved win rates 30%, and I ran 30+ structured interviews with OEMs and distributors so the messaging reflected what technical buyers actually needed rather than what sounded good internally. That same discipline, go talk to the buyer before you write the one-pager, is what keeps a battlecard or FAQ useful instead of stale.

Market and competitive research is the other half of the role, and it is where I have the most reps. At Sensata I tracked competitive moves and market share across EMEA and the US to feed positioning and launch decisions with current intelligence, not a quarterly snapshot. At Applied Materials today I size the semiconductor market with Sales, Engineering and Accounts and automate the recurring analysis with AI agents built on Claude, which frees up hours for the research synthesis and messaging work a launch actually needs. A sovereign AI cloud platform moves fast enough that this habit, automate the repeatable research, spend the saved time on the story, maps directly onto what your team is asking for.

I like that this role is explicit about learning a highly technical environment quickly while managing multiple workstreams at once; that is the condition I have worked in across semiconductors, industrial sensing and now AI infrastructure. Proof trail at adhi-product-ai.vercel.app/ref/nscale.
