

PITCH DECK | BREX SENIOR GROWTH MARKETING MANAGER, PAID SOCIAL

You are hiring someone to turn Meta into a predictable acquisition engine, not a media line item, with signal architecture and down-funnel pipeline as the scoreboard. I have already run that exact pattern, twice, at two budget scales.

Meta ownership end to end, from audience strategy and creative testing to CAC and pipeline, plus the AI-native reporting habit that keeps the testing loop moving.

3x ROAS in one month at Pixis via full-funnel Meta restructuring

-25% CPA at Plug Power across Google, Meta and LinkedIn on \$100K/month

Amplitude + Tableau audience work lifting blended ROAS 40% at Pixis

8-client, \$15K-\$90K/month paid-social portfolio owned end to end

AI agents built on Claude automating my own reporting at Applied Materials

The mandate is not "run more Meta ads." It is **signal architecture, structured testing and a defensible CAC number.**

What that actually requires

Meta has to carry both a self-serve motion and a sales-led motion on the same budget, with down-funnel pipeline, not just clicks, as the metric that matters.

Signal quality (CAPI, server-side tracking, offline conversion data) has to improve continuously so the platforms can optimize toward real customers, not just leads.

Testing has to be structured and documented across audiences, bidding, creative and optimization events, so paid social becomes predictable, not a string of one-off wins.

What I have already run

At **Pixis**, I owned Meta as the primary channel for an 8-client, \$15K-\$90K-per-client-per-month portfolio and delivered 3x ROAS in a month through full-funnel restructuring, not one lever.

At **Plug Power**, I ran Paid Search and Paid Social across Google, Microsoft, Meta and LinkedIn end to end, cutting CPA 25% through structured, hypothesis-driven testing.

At **Applied Materials** today, I automate my own recurring forecasting and reporting with AI agents built on Claude, the same discipline a structured testing engine runs on.

The through-line: every channel I have owned, I have also had to defend on CPA, ROAS or pipeline to someone accountable for the budget, and I have already automated a piece of that reporting loop, not described it in a slide.

What the posting asks for, and where the proof already sits.

What the role covers

"Own, scale, and optimize our Paid Social engine, with Meta as the core growth driver."

"Engineer signal architecture, build scalable audience models, and establish a high-velocity creative testing engine."

"Build and execute a continuous, hypothesis-driven testing framework across audiences, bidding strategies, optimization events, landing pages and creative concepts."

My proof

Pixis, Meta owned end to end: shopping feed cleanup, smart bidding, creative refresh and lookalike-audience expansion delivered 3x ROAS in a single month for a fashion brand.

Pixis, signal and audience work: Amplitude and Tableau on user behavior across 30+ campaigns lifted blended campaign ROAS 40% through first-party audience and cohort analysis.

Plug Power, closed-loop tracking: automated the Salesforce, Adobe Analytics and Google Tag Manager stack for event-based, closed-loop conversion reporting.

Plug Power, structured testing: ran 15+ A/B tests across creative, bidding and audiences, tying paid social performance to MQL quality and stage-1 pipeline.

Own the channel, beat the target, then automate the loop so the next test starts sooner.

Same pattern at two budget scales: full ownership of Meta and the surrounding channel mix, a measured CAC or ROAS result, and an automation that removed a manual step from the next testing cycle.

3x ROAS

Pixis, One-Month Turnaround

Full-funnel Meta restructuring for a fashion client: shopping feed cleanup, smart bidding, creative refresh and lookalike expansion, not one isolated lever.

-25% CPA

Plug Power, Paid Search + Social

Bid optimization and structured A/B testing across Google, Microsoft, Meta and LinkedIn on a \$100K/month budget spanning multiple business units.

+40% ROAS

Pixis, Amplitude + Tableau Audience Work

First-party audience and cohort analysis across 30+ campaigns lifted blended campaign ROAS 40%, feeding lookalike and retargeting models.

None of these were single-channel wins. Each one closed the loop from Meta spend to a business metric someone else was accountable for, then automated a piece of the process so the next test started faster.

What the first month owning Brex's Meta-led paid social engine looks like.

WEEK 1

Map Meta spend to self-serve and sales-led pipeline

Pull current Meta spend, CAC and conversion signal quality by motion (self-serve versus sales-led), and sit with Analytics and Marketing Ops to find where CAPI or offline conversion data is thinning out the picture platforms optimize against.

Why first: the same first move behind every channel I have owned. The signal shortfall shows up in the data before anyone names it.

WEEK 2-3

Stand up the structured testing framework

Build the first hypothesis-driven test across audiences, bidding or creative, whichever is the current bottleneck, in partnership with Brand and Design, and document the learning so the next test starts from evidence, not a guess.

Why now: the same discipline that delivered 3x ROAS at Pixis and cut CPA 25% at Plug Power.

WEEK 4

Report the first CAC and pipeline trendline

Bring event-based tracking current enough to show one real trendline: CAC by motion, moving in the right direction, with downstream pipeline attached and the next test already queued behind it.

Why this fast: a clean number beats a plan. Every role on my resume has been measured by the metric moving, not the deck describing it.

CLOSE

You are hiring someone to turn Meta into a compounding, signal-driven acquisition engine tied to real pipeline. I have already run that pattern at two different budget scales.

The core proof is Pixis and Plug Power together: **3x ROAS in one month** owning Meta end to end for an 8-client portfolio, and **-25% CPA** running Paid Search and Paid Social across Google, Microsoft, Meta and LinkedIn on \$100K/month, both closed with structured testing, not just spend.

What is harder to find is someone who has already automated a piece of their own reporting loop instead of just talking about AI. At Applied Materials I run recurring forecasting through agents built on Claude, because rebuilding the same report every cycle is time that belongs on the next test.
