PITCH DECK | AIRWALLEX SENIOR ASSOCIATE, GROWTH STRATEGY & OPERATIONS (EXPERIMENTS/CAMPAIGNS)

An experimentation backlog only moves the business when the tracking taxonomy, the dashboard and the QA gate behind it already exist. I run that build today, pointed at pricing exceptions and sales pipeline instead of campaigns.

A taxonomy-and-dashboard discipline built and measured before: a 1,200-opportunity pipeline tracked against a $627M target, a guardrail engine that scores every exception against precedent, and Claude agents automating the repetitive analysis behind both.

- **$433M Surfaced** - Sensata Bleeders & Leakers dashboard, 1,200 opportunities vs $627M target
- **15+ A/B Tests** - Plug Power SEM/Social, tied to MQL quality and stage 1 pipeline
- **CRM/CPQ/Deal-Approval Workflow** - PriceKeel, Finance-ready audit trail
- **Claude AI Agents** - automating repetitive analysis with human review today
- **$700K+ Recovered** - highest-confidence opportunities first, two quarters

WHY THIS DECK EXISTS

Running Airwallex's experimentation engine means one backlog, one tracking taxonomy and one QA process has to hold across Commercial, Product, Engineering, Data and Legal at once. That is an operations-and-measurement discipline, not a testing calendar.

What the mandate actually requires

One experimentation backlog and campaign calendar that survives contact with seven different functions, not a spreadsheet only Growth reads.

A tracking taxonomy and dashboard built well enough that a test result reads as the next decision, not a debate.

Repeatable systems (checklists, QA scripts, readout templates) that let AI take the repetitive work, with a human check before anything customer-facing ships.

What I have already built at that layer

Built the **FY2026 Bleeders & Leakers Power BI dashboard** at Sensata: 1,200 opportunities tracked against a $627M target by win rate, dollar-per-win and stage, across 3 regions and 20 product lines.

Run **PriceKeel's CRM, CPQ and deal-approval workflow** end to end, with a guardrail engine that scores every exception against closed-won and closed-lost precedent and a Finance-ready audit trail behind it.

Automate repetitive analysis with **Claude AI agents** at Applied Materials today, human review in the loop before anything reaches leadership.

The through-line: the backlog-plus-taxonomy-plus-QA-gate loop this role runs is one I already operate twice, once on a pricing exception queue and once on a 1,200-line opportunity pipeline.

THE MANDATE, MAPPED

What the role covers, and where the proof already sits.

What the role covers

> *Manage the experimentation backlog, campaign calendar, measurement approach, tracking taxonomy, dashboards, QA processes and reporting.*

> *Identify gaps in tooling and process, then codify repeatable work into scalable systems. Use AI with clear guardrails and human review.*

> *Partner with FP&A on forecasting and budget tracking, balancing speed with experimental rigour.*

My proof

Sensata taxonomy and dashboard: $433M in margin gaps surfaced and ranked by salesperson and product line, not left as a static report.

PriceKeel guardrail engine and checklists: every discount exception scored against precedent, QA gates built once and reused for every decision.

Plug Power and Applied Materials: built the $100K/month budget plans leadership approved, and the forecasting models multiple product groups run their targets against today.

THE CLOSED-LOOP PROOF, IN DEPTH

Sensata: a tracking taxonomy built from scratch, not handed a finished dashboard.

Built against a live $627M target with three regions and 20 product lines reporting into it, the same build-the-taxonomy-then-decide-what-runs-next loop an experimentation engine runs on test variants and campaign IDs.

1,200 Opportunities

Tracked Against a $627M Target

Built the win-rate, dollar-per-win and stage-distribution taxonomy from the ground up across 3 regions and 20 product lines.

$433M Surfaced

Margin Gaps Ranked for Leadership

Turned the dashboard into a prioritization tool, ranking opportunities by salesperson and product line instead of leaving it as a report.

$700K+ Recovered

In Two Quarters, Highest-Confidence First

Closed the ranked backlog starting with the opportunities the data said would pay off fastest.

The same discipline carries to Plug Power, where 15+ A/B tests across SEM and Social were tied to MQL quality and stage 1 pipeline, and to Applied Materials, where I automate the repetitive side of forecasting with Claude AI agents today.

FIRST 30 DAYS

What the first month running Airwallex's experimentation engine would look like.

WEEK 1

Map today's backlog, calendar and tracking taxonomy end to end

Sit with Commercial, Product, Data and Legal on exactly how a hypothesis becomes a test today, the same mapping discipline that shaped Sensata's Bleeders and Leakers taxonomy before a single dashboard got built.

Why first: a QA gate built before the current workflow is understood breaks on contact with the first real campaign.

WEEK 2-3

Codify the highest-friction step into a checklist or QA script

Pick the one handoff that causes the most rework, a prioritization call, a launch QA step, a readout template, and turn it into reusable tooling, the way PriceKeel's discount-exception process became checklists and guardrails instead of case-by-case judgment calls.

Why now: one scaled fix beats ten small cleanups nobody reuses.

WEEK 4

Ship one dashboard and one readout template every function will use

Hand Commercial, Product and Data the same measurement view and reporting cadence, the same handoff that let Sensata leadership rank $433M in opportunities instead of arguing about which ones mattered.

Why this fast: a taxonomy only Growth trusts does not change what ships next.

CLOSE

This role needs someone who has already run the backlog-taxonomy-QA-gate loop at scale, not someone building their first tracking dashboard on Airwallex's budget. I have.

The core proof is Sensata: a tracking taxonomy and Power BI dashboard built from the ground up, tracking 1,200 opportunities against a $627M target by win rate, dollar-per-win and stage across 3 regions and 20 product lines, surfacing **$433M** in margin gaps and recovering **$700K+** in two quarters.

What is harder to find is someone who also runs the guardrail-and-QA side of that loop today: PriceKeel's CRM, CPQ and deal-approval workflow with a Finance-ready audit trail, 15+ A/B tests tied to pipeline quality at Plug Power, and **Claude AI agents** automating the repetitive analysis at Applied Materials with a human check before anything goes out. I bring the same loop to Airwallex's experimentation backlog.
