Hiring Team, DoorDash

At Sensata I ran the Bleeders and Leakers program: a structured governance cadence covering 1,200 pricing opportunities against a \$627M target across three regions, with a clear intake-to-decision path for every exception raised on a live deal. That is close to the loop your posting describes for the 3P tooling council: evaluate, score, route to the right stakeholders, then renew or retire. My version of that cadence recovered \$700K+ in margin in two quarters, not by writing a report but by sitting in the room and closing what the dashboard flagged.

Governance only holds up if someone owns the systems underneath it, not just the process on paper. I founded PriceKeel and run the company's CRM, CPQ, forecast reviews and deal approvals myself, as the only ops person in the building, and I built the audit trail Finance needs before it was ever a full team's job to maintain. That is the same build vs buy instinct a tooling council needs when it is deciding whether a new SaaS license earns its seat in the stack or a spreadsheet already does the work.

The AI-native piece is not new for me either. At Applied Materials I automate recurring revenue analysis with agents built on Claude, and outside of work I built SwipeHire, an AI job-matching platform, from a blank PRD through a shipped product with its own pricing model. Prototyping automation to kill manual work is a habit I already have, not something I would need to pick up on the job.

I would bring that same habit, own the system and the decision, not just the dashboard, to the Sales Tooling seat at DoorDash. Proof trail at adhithyabhaskar.vercel.app/ref/doordash.
