Hiring Team, Lightsage

Your posting wants a PM who can take an ambiguous customer problem from discovery through launch without much hand-holding. At Sensata I ran exactly that loop on a 100+ feature backlog: I interviewed 30+ OEM and distributor engineers to find where integrations actually broke, then treated the recurring questions as design problems instead of support tickets. That shift lifted CSAT 22% and feature adoption 18% across 50,000+ connected devices, and it is the same discovery-to-launch habit your agent analytics and recommendations surface needs.

The API performance and data-pipeline side of this role is close to how I already build. I wrote SwipeHire's PRD from a blank page and built it on the OpenAI API, then instrumented every funnel step in GA4 and GTM so the usage data, not my opinion, decided what shipped next. 8+ A/B tests later, activation was up 25%. I treat the API and the data pipeline behind it as one product decision, not two separate workstreams handed off between teams.

I also run the operating side, not just the roadmap. At Plug Power I automated the Salesforce, Adobe Analytics, GA and Google Tag Manager reporting chain end to end so the recurring data workflow did not need a person checking it every week, and at Pixis I owned direct account relationships across an 8-client, \$15K-\$90K/month portfolio, cutting churn 50% through proactive strategy rather than reactive fixes. At Applied Materials I build my own Claude agents to cut the repetitive side of forecasting, which is the same instinct a small product team needs from its first PM hire: automate the parts that do not need a human, so the human time goes to the customer problems that do.

I would like to talk about what a first 90 days on agent analytics and API performance should look like, since that is the part of this role I would want moving fastest. Proof trail at adhi-product-ai.vercel.app/ref/lightsage.
