Hiring Team, Socure

Your posting describes a builder who turns a buying signal into an automated, personalized send, not someone running a static nurture calendar. At Plug Power, I automated the WordPress-to-Pardot lead flow into exactly that: a signal-triggered send that cut cost per lead 50%, with the SEM and SQL work behind it tying signal strength to MQL quality and stage 1 Salesforce opportunities. That is the same close loop your lifecycle roadmap needs from first engagement to pipeline.

The AI-agent half of the role is a habit I already run, not a new skill to pick up. At Applied Materials, I automate repetitive market and competitive analysis with agents built on Claude instead of rebuilding the same report every cycle, and that saved time goes straight into the next forecasting model. Give me a signal, a channel and a guardrail to prototype against, and that is where I start.

Lifecycle work is a KPI framework first, for me. At Sensata, I built one in SQL and GA4 across 50K+ connected devices that flagged accounts stalling before they churned, feeding +35% qualified leads out of our email and launch campaigns. At Pixis, I ran the retention side of the same problem, re-engagement and channel playbooks that cut client churn 50% across an 8-client portfolio, the same engagement-to-expansion-to-closed-lost arc a lifecycle program is built to cover.

The pipeline-measurement discipline a program like this runs on is the same one behind the Power BI dashboard I shipped at Sensata: 1,200 opportunities tracked against a $627M target by stage and region, the kind of signal-to-SQL, signal-to-meeting view your roadmap is accountable for. Proof trail at adhi-growth-ai.vercel.app/ref/socure.
