PITCH DECK | SOCURE LIFECYCLE MARKETING MANAGER

Socure needs someone who turns a buying signal into an AI agent that researches the account, drafts the message and hands a warm lead to Sales, not someone who manages a nurture calendar. I built that discipline by hand before "agent" was the word for it, and I run the AI-agent half of it in production today.

A signal-triggered lead-flow system that halved cost per lead, and a Claude-agent habit already shipping, on the same resume.

- **50% Lower Cost Per Lead** from a signal-triggered lead-flow automation at Plug Power
- **+35% Qualified Leads** from signal-led email and launch campaigns at Sensata
- **50% Client Churn Cut** across an 8-client retention portfolio at Pixis
- **AI Agents Built on Claude** automating my own recurring work today at Applied Materials
- **1,200-Opportunity Pipeline Dashboard** tracking signal-to-SQL movement at Sensata

WHY THIS DECK EXISTS

The role is not "manage a nurture calendar." It is building the signal-to-agent-to-SDR system that decides who hears from Socure, when, and with what message.

What that actually requires

A ranked set of first- and third-party signals, web/content engagement, webinar behavior, intent data, Salesforce stage movement, turned into triggers with real entry and exit rules, not one static score.

AI agents that research the account, draft the message and choose the channel, with brand-voice and compliance guardrails and a human approval step, not a fire-and-forget bot.

Email owned as a channel end to end, signal-triggered sends, nurture, re-engagement and expansion programs, measured on signal-to-meeting and signal-to-SQL, not open rate.

What I have already run

At **Plug Power**, I automated the WordPress-to-Pardot lead flow into a signal-triggered send, cutting cost per lead 50%, then tied SEM performance to MQL quality and stage 1 Salesforce opportunities.

At **Applied Materials**, I run AI agents built on Claude against recurring analysis work today, the same Claude-first prototyping habit this role is built on.

At **Sensata**, I built the KPI framework in SQL and GA4 that flagged high-intent signals before accounts stalled, feeding +35% qualified leads out of email and launch campaigns.

> **The through-line: every system I have built started with a signal, not a calendar date, and ended with a number Sales or Marketing Ops could point to.**

THE MANDATE, MAPPED

What the posting asks for, and where the proof already sits.

What the role covers

> *"Define/rank first- and third-party signals... turn them into triggers with entry/exit rules."*

> *"Design and deploy AI agents... prototype with Claude, Clay, Zapier/n8n."*

> *"Own email as a channel: signal-triggered sends, nurture, re-engagement, customer/expansion programs."*

My proof

Plug Power, the signal-to-send system: automated a WordPress+Pardot lead flow into a signal-triggered send, cutting cost per lead 50%, SEM tied to MQL quality and Salesforce stage movement.

Applied Materials, the agent habit: automates repetitive market and competitive analysis with AI agents built on Claude, the same Claude-first pattern this role asks for.

Sensata, email as a channel: led email and paid launch campaigns for new sensing products, generating +35% qualified leads, on top of a SQL/GA4 signal framework across 50K+ devices.

THE PROOF, IN DEPTH

Map the signal, automate the send, then put a number on it.

Same pattern across three companies: find the signal before it becomes a stalled account, ship the automated program against it, then measure whether it moved a number Sales or Marketing Ops was accountable for.

50% Lower CPL

Signal-Triggered Lead-Flow Automation

Automated the WordPress-to-Pardot flow at Plug Power into a signal-triggered send, cutting cost per lead in half.

+35% Qualified Leads

Email & Launch Campaigns, Signal-Led

Built on a SQL/GA4 KPI framework across 50K+ connected devices that flagged high-intent accounts first, at Sensata.

50% Churn Cut

Retention & Re-Engagement, 8-Client Portfolio

Proactive account strategy and channel playbooks that kept at-risk accounts inside the funnel at Pixis.

None of these was a one-time campaign. Each one closed the loop from signal to a number Sales or Marketing Ops was accountable for.

FIRST 30 DAYS

What the first month building Socure's signal-to-agent-to-SDR system looks like.

WEEK 1

Map the signal stack end to end

Rank the first- and third-party signals already live in Salesforce and web/content engagement data, and write entry and exit rules for the first trigger, so the first AI agent acts on a real signal, not a guess.

Why first: the same first move behind the Plug Power lead-flow automation, define the trigger before you automate the send.

WEEK 2-3

Ship the first signal-triggered agent

Build the first AI agent, research the account, draft the message, choose the channel, route the warm one to SDRs with context, with brand-voice and compliance guardrails and a human approval step, prototyped on Claude.

Why now: the same Claude-first prototyping habit already running in production at Applied Materials.

WEEK 4

Stand up the measurement loop

Instrument signal-to-meeting and signal-to-SQL tracking against the pipeline-dashboard discipline built at Sensata (1,200 opportunities, $627M target, by stage and region), then feed results back into the trigger rules.

Why this fast: the same pipeline-velocity view this role is accountable for, built once already.

CLOSE

You are hiring someone to build the signal-to-agent-to-SDR system behind Socure's pipeline, not inherit one. I have already built the pieces separately, and they are ready to be built together here.

The automation half: **50% lower cost per lead** from a signal-triggered lead-flow system built at Plug Power, with SEM and SQL work tying signal strength to MQL quality and Salesforce stage movement.

The agent half: AI agents built on **Claude** running my own recurring analysis today at Applied Materials, plus the KPI-framework and pipeline-dashboard discipline from Sensata that turns a signal into a number Marketing Ops can track.
