Hiring Team, Maximus

A price-to-win analysis lives or dies on the spreadsheet under it: every assumption about a competitor's cost structure and pricing has to be organized, sourced and defensible before a bid goes out. I built that kind of spreadsheet at Sensata, tracking 1,200 pricing opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines in a Power BI dashboard that surfaced \$433M in margin gaps for leadership to act on. Before that, I benchmarked 10+ competitors to reprice parts and help drive +8% market share, the same competitive research your price-to-win work runs on.

The research habit goes back further than that. As a Product Marketing Intern at Sensata I broke down our top three competitors' products, promotions and positioning and reviewed POS accounts for growth markets, turning that into Power BI dashboards leadership used for distribution-strategy calls. That is the same attention to detail your posting asks for: research and data organization that holds up when someone checks the numbers.

I also bring the Excel and modeling side. At Applied Materials I forecast value-based pricing and inflection points in Excel across multiple product groups, sizing the market with Sales, Engineering and Accounts so pricing decisions rest on one shared view instead of five conflicting ones. I run that same research process with Claude AI agents now, which means less time spent assembling the spreadsheet and more time on the judgment calls a competitive analysis actually needs.

One instinct I would bring to this seat specifically: a price-to-win model is only useful if it tells you which assumption to challenge, not just what the number came out to. The Bleeders and Leakers dashboard mattered because it told leadership which \$433M of the gap to chase first. I would want Maximus' price-to-win research to do the same: flag which competitor assumption is shakiest before the proposal locks it in. Proof trail at adhithyabhaskar.vercel.app/ref/maximus.
