Hiring Team, Imperative Care

Your posting asks this Product Manager to map user needs with physicians, clinicians, sales and R&D, then turn that into a defined problem, desired output and solution boundary. That is the exact motion I ran at Sensata: 30+ structured interviews with OEMs and distributors to find where our sensing products actually broke down in the field, then I owned the roadmap and 100+ feature backlog that fixed it, cutting time-to-market 20% and lifting CSAT 22%.

Developing the core value proposition is a big part of this role, and it is work I have already shipped. I built the value proposition and technical positioning for new sensing products, then trained and equipped 50+ field reps with case studies and support tools so they could hold their own with engineers and buyers instead of reading off a spec sheet, which moved win rates 30%. I would bring that same approach to training your sales force and clinicians on the technical story behind Imperative Care's devices.

I also benchmark competitors on features, pricing and warranty terms before I recommend a product change, not after. That work at Sensata repriced distributor and channel parts and raised margins from 53% to 61%. I carry P&L and revenue targets today at Applied Materials, where I build the leadership decks and run the OKR cadence that keep management current on project accomplishments and risk, the same operating rhythm this role calls for.

I would welcome the chance to talk through how this maps to the product pipeline you are building for stroke and vascular care. Proof trail at adhi-product.vercel.app/ref/imperative-care.
