Hiring Team, Visa

A 100+ feature backlog for connected sensing products passed through my hands at Sensata end to end: I wrote the roadmap, worked with engineering in Agile across 3 regions, and shipped releases 25% faster while cutting time-to-market 20%. That is the same shape of ownership your Issuer Digital Products posting describes: one person carrying a product from concept through launch, then staying close enough to the data to know whether it worked.

The post-launch half of that job is where I spend most of my time. At Sensata I built KPI frameworks in SQL and GA4 across 50K+ connected industrial devices, using adoption and cohort signals to reprioritize the backlog and lift feature adoption 18%. At Applied Materials now, I run market and competitive analysis for a fast-moving market and automate the repetitive parts of it with Claude AI agents, so more time goes into the calls that actually move a roadmap.

What pulled me toward this specific opening is the AI/GenAI angle sitting inside a digital issuer product. I built SwipeHire, an AI job-matching product on the OpenAI API, from a blank PRD to 50+ early users, running 8+ A/B tests and 12+ interviews to find what actually drove activation. I know what it takes to ship a consumer-facing digital product end to end and then defend it with data, and I want to bring that same discipline to issuers who will judge your platform the way SwipeHire's users judged mine: by whether it worked the first time they touched it.
