Hiring Team, Netflix

Two quarters into the Bleeders and Leakers program at Sensata, I had recovered $700K in margin by ranking 1,200 pricing opportunities against a $627M target across 3 regions and 4 product families, then showing account teams exactly which quotes to reprice and why. That is the loop your posting describes: a pricing principle built on consumer demand and competitive data, turned into a recommendation a regional leader can actually act on, not just read.

The distributor work is where the elasticity and willingness-to-pay thinking actually got tested. I raised distributor and channel-partner margins from 53% to 61% by rebuilding how parts sold through distribution were priced, which meant modeling what a partner would accept before proposing a change, not after. I ran that program while carrying P&L and revenue targets for a multi-$100M industrial business, and the price realignment that followed drove 12% YoY revenue and 8% market share against 10 or more competitors. I also sat with senior executives directly on the memos and revenue scenarios behind those calls, which is the part of the role your posting calls out explicitly: distilling a pricing trade-off into something a non-pricing audience can decide on in one read.

At Applied Materials now, I run a smaller version of the same problem: a market where demand is shifting fast enough that the pricing framework has to forecast the inflection point instead of reacting to it, built jointly with Sales, Engineering and Accounts rather than handed down from one function. My own read on consumer demand comes from the other side of my background: an eight-client D2C ad-spend portfolio at Pixis and a 16x-ROAS run at GenY Medium, both built on reading what a consumer market actually responds to before a team commits budget behind it.

What I think I bring beyond the resume is that I am also building PriceKeel, an AI-driven decision-integrity layer for B2B deal pricing, which means half of my week right now is spent designing exactly the kind of auditable pricing logic a team running pricing globally and locally at once eventually wants. I would like to bring both halves to this role: someone who has already closed a real margin gap with a model and a negotiation, and someone who thinks about how to make that process repeatable at scale.
