Hiring Team, Scale AI

At Pixis I ran an 8-client portfolio with \$15K-\$90K in monthly budget per account and full P&L ownership. The hard part was never landing a client, it was keeping the ones I had productive: churn dropped 50% once I built vertical playbooks and diversified channels per account instead of treating every client the same. That is close to the problem your posting describes: a marketplace where the real growth lever is not sourcing supply, it is activating and retaining the supply you already have.

I also know what it is to build the operating system for a multi-sided process from zero. As founder of PriceKeel I set up the CRM, CPQ, forecast and pipeline reviews and deal approvals myself, and built the audit trail that shows the reasoning behind every pricing decision, because the people downstream need to trust the number, not just see it. That is the same discipline a team needs to forecast capacity and catch funnel bottlenecks before they slow a customer project down.

Your posting is specific about SQL or Python, and I would push that further: the dashboard matters less than knowing which number in it is wrong. At Sensata I built the Bleeders & Leakers Power BI dashboard tracking 1,200 pricing opportunities against a \$627M target, and the useful part was not the dashboard, it was the \$433M in gaps it surfaced once I broke the funnel down by stage and by salesperson. I run the same instinct on AI tooling: I build and run agents on Claude to clear the repetitive half of that analysis, because a tool from six months ago is already behind.

Scale's Outlier marketplace is an unusual growth problem: the people you are growing are also the product's quality control. I would like to bring the activation-to-retention discipline I built at Pixis and the zero-to-one operating rigor from PriceKeel to that problem.
