Hiring Team, Perplexity

Your posting asks for a PM who can go from PRD to shipped feature without a hand-off, on a small team where nobody else is going to own the ambiguous part. I built SwipeHire that way: wrote the PRD, scoped the MVP, and shipped an AI job-matching platform (Python, OpenAI API, React) alone, then instrumented the GA4/GTM analytics stack myself and ran 8+ A/B tests against 12+ user interviews to find out what actually moved activation. It moved 25%, and every one of those decisions was mine to make and mine to be wrong about.

Enterprise industries are where I have spent most of my product time, and the roadmap work looks a lot like what you are describing for Computer. At Sensata I owned the roadmap for a sensor product line end to end: a 100+ feature backlog managed with engineering in Agile across three regions, and a KPI framework in SQL and GA4 reading 50K+ connected industrial devices for adoption signals, the kind of loop that turns iteration into a habit instead of a one-off sprint. 30+ interviews with OEMs and distributors told me exactly where the product broke down for them, and closing those gaps raised CSAT 22%. That is the same instinct your posting calls understanding qualitative and quantitative data together, and it is why I would want to bring it to search and Computer specifically: the JD says highlight the industry I want to innovate in, and mine is industrial and enterprise workflows, where the gap between what a tool can do and what a non-technical operator actually uses is usually the whole opportunity.

Hard calls without a clean answer are the other half of this job, and I make them with data instead of opinion. At Applied Materials now, I build the forecasting and market-sizing models that call the semiconductor market's next inflection point before it is obvious, partnering closely with Sales, Engineering and Accounts to get to one view the whole team can build a roadmap against. I have also started building Claude AI agents to take the repetitive analysis off my own plate, so the hours go to the judgment calls instead of the tenth version of a spreadsheet, which is the same trade a small team with no slack in its headcount has to make on everything it ships.

I would want to talk about where Computer's roadmap needs someone who takes the ambiguous, unscoped piece first. Proof trail at adhi-product-ai.vercel.app/ref/perplexity.
