Hiring Team, Supermicro

Your workstation posting is built around one number: new pipeline, and whether the field has what it needs to close it. I built that exact engine at Sensata Technologies, training 50+ reps as the product SME behind new sensing hardware, with case studies and competitive tools that lifted their win rates 30%. The dashboard behind it, the FY2026 Bleeders and Leakers model in Power BI, tracked 1,200 pricing opportunities against a $627M target across 3 regions and 20 product lines, the kind of pipeline and forecast discipline your business reviews would run on.

The go-to-market half of the role is the same motion I ran for Sensata's new sensing product line: positioning, channel and launch across North America and Europe, which drove $2M+ in first-year revenue. I got there by running 30+ interviews with OEM and distributor partners and tracking competitor moves across EMEA and the US, then turning both into target-account selection and messaging that Engineering and Sales could both use. That is the same bridge your posting draws between Product Management, Engineering and FAEs, built from the partner and customer side instead of a brief handed down from above.

At Applied Materials today I size markets with Sales, Engineering and Accounts and have automated the recurring forecast cycle with Claude AI agents, so the hours go into the next account instead of rebuilding last quarter's report. Supermicro's workstation line is growing inside a company that is already one of the fastest-growing in Silicon Valley, and a go-to-market function that scales with it needs enablement and pipeline tracking built before the growth outruns it, not after.

I would like to bring that discipline to the workstation line at Supermicro. Proof trail at adhi-product-ai.vercel.app/ref/supermicro.
