Hiring Team, Cisco

Your Product Manager posting asks for someone who can turn structured customer discovery and telemetry into product requirement documents enterprise engineering teams can actually build against, and that loop is the job I already run. At Sensata, I owned the product roadmap for sensor solutions sold into automotive and industrial accounts, ran 30 or more structured interviews with OEMs and distributors, and read usage and telemetry data from a network of 50,000-plus connected devices in SQL and GA4 to decide what the next 100-plus feature backlog item should be. The result was a 25% faster release cadence, a 20% shorter time to market, and an 18% lift in feature adoption, the same three outcomes your posting lists under Your Impact.

The posting is also specific about agentic AI, not as a buzzword but as a way to accelerate discovery and delivery cycles. At Applied Materials, I use AI agents built on Claude to automate the repetitive side of forecasting and market research, which frees up time for the judgment calls: sizing the semiconductor equipment market with Engineering, Sales and Accounts, and keeping pricing and roadmap decisions ahead of demand instead of reacting to it. That is the same discovery-to-insight acceleration your team wants a PM to bring to early access programs and competitive analysis ahead of general availability.

I also know what it costs to ship a feature that a Fortune 500 customer actually adopts versus one that just ships. At Sensata, I translated technical features into customer-value positioning and built sales enablement for 50 or more reps, lifting conversion 15% on priority launches, because a roadmap item is not done when engineering closes the ticket, it is done when the field team can sell it and the customer uses it. I built that same discipline from zero on SwipeHire, writing the PRD, scoping the MVP, and running 8 or more A/B tests to lift activation 25% to 50-plus early users, with no engineering team handed to me to start.

Cisco's platform work spans enterprise customers who need API-first capabilities built around real usage patterns, not assumptions, which is exactly the kind of outside-in product work I would want to keep doing here. Proof trail at adhi-product.vercel.app/ref/cisco.
