Hiring Team, Google

The posting for Product Strategy and Operations asks for someone who can take a tech ecosystem that spans small startups to large public companies and turn the financials and metrics inside it into something a senior leader can act on in one sitting. At Sensata, I built the FY2026 Bleeders and Leakers Power BI dashboard, ranking 1,200 pricing opportunities against a \$627M target across 3 regions and 20 product lines, then surfaced \$433M in margin gaps that leadership used to decide where to focus the next quarter instead of debating it in a meeting.

That same discipline runs the inflection-point forecasting I do at Applied Materials today, where field and technical input from Sales, Engineering and Accounts gets folded into one market view before pricing and resourcing decisions get made on it. At Sensata I carried that further into AP26 revenue models and site-transition strategy directly with senior executives, the kind of ad hoc, discretion-heavy project a small team doing cross-cutting work for leadership runs constantly, not occasionally.

My opinion on this kind of work is that a "cohesive set of data, insights and deliverables" only earns that description if one person owns the full chain from raw numbers to the recommendation, which is why I build my own models in SQL and Python instead of waiting on someone else's handoff. Sensata's AP26 revenue modeling and Applied Materials' market sizing have run me through that same discipline from inside two operating companies, across semiconductors and industrial sensing. I also automate the repetitive parts of my own analysis with AI agents built on Claude, so tracking a shifting AI model landscape is already how I work, not something to pick up after joining.
