PITCH DECK | TIKTOK MONETIZATION STRATEGIST (ANALYTICS)

A monetization data science team does not need another dashboard. It needs a metrics framework that tells risk apart from opportunity before the quarter closes. I have built exactly that model, twice.

Metrics-framework design, statistical attribution and the SQL/Power BI discipline to turn monetization data into a decision.

- **$627M** pricing-opportunity model built from scratch, scoring 1,200 line items
- **$433M** in margin gaps surfaced for leadership to prioritize
- **$700K+** recovered in 2 quarters once the model's calls were acted on
- **Appsflyer + Adjust** mobile attribution run across an 8-client ad portfolio
- **Guardrail engine** that scores every exception as risk or opportunity, built as a company at PriceKeel

WHY THIS DECK EXISTS

A monetization team never runs out of signal. It runs out of time to turn signal into a framework before the trend goes stale.

What a monetization data science team runs into

Every commercial product throws off more events than anyone can read by hand; the job is building the metrics framework that separates a real risk or opportunity from noise, fast.

Attribution is the hard part. A trend that looks causal in one cut of the data often is not, and a wrong call shapes the next quarter's goal-setting.

The output has to move PMs, engineering, sales and strategy at the same time, or the research sits in a deck no one acts on.

What I have already run, at comparable scale

At **Sensata**, I built a $627M-opportunity Power BI model from 1,200 raw line items, scoring each one and surfacing $433M in margin gaps leadership could act on.

At **Pixis**, I ran mobile and retail-media attribution (Appsflyer, Adjust, Amazon Ads, Criteo) across an 8-client ad portfolio, then used Amplitude and Tableau to separate signal from noise.

At **PriceKeel**, I built the risk-versus-opportunity classifier itself: a guardrail engine and audit trail that make the call defensible, not just directional.

This req asks for metrics frameworks, statistical attribution and research that moves business goal-setting. That is the exact loop above, run on monetization data instead of industrial pricing data.

THE REQ, MAPPED

What the Monetization Strategist opening asks for, and where the proof sits.

What the role covers

> *"Design metrics frameworks for commercial products, analyze key trends, and plan research topics that improve monetization ROI."*

> *"Fluency in SQL/Hive and R or Python; knowledge of quantitative attribution methods."*

> *"Works with PMs, engineering, sales and strategy teams on risk/opportunity identification."*

My Proof

Bleeders and Leakers model at Sensata: a metrics framework turning 1,200 pricing opportunities into $433M in margin gaps surfaced and $700K+ recovered.

SQL and GA4 KPI frameworks: built on 50K+ connected devices at Sensata to find the adoption signal buried in the noise.

Attribution in production: Appsflyer and Adjust for mobile UA, Amplitude and Tableau for behavioral analysis, at Pixis.

Cross-functional reach: AP26 revenue models and multimillion-dollar customer quotes carried with senior executives and Sales at Sensata.

THE SENSATA PROOF, IN DEPTH

Bleeders and Leakers: a metrics framework that turned into a number leadership acted on.

Built as a BU-wide Power BI system covering 1,200 pricing opportunities against a $627M target across 3 regions, 4 product families and 20 product lines, with pipeline funnel, win rate and stage distribution.

$433M

Margin Gaps Surfaced

The model's job: separate a real opportunity from noise across 1,200 line items in one view.

$700K+

Margin Recovered in 2 Quarters

Closed through alignment with Sales and Finance, grounded in competitive gaps and willingness to pay.

53% to 61%

Distributor Margin Lift

Repricing executed and brought to leadership for sign-off, not just modeled.

The same model also flagged line items where a price change could lift profitability more than 50%, a recurring trend-and-opportunity scan close to this req's "analyze key trends" responsibility.

FIRST 30 DAYS

What the first month on TikTok's Monetization Products data science team looks like.

WEEK 1

Learn how a monetization call gets made today

Sit with the Monetization Products PMs, engineering and strategy teams to map how a recent risk/opportunity call moved from raw data to a decision, and where the metrics framework already exists versus where it is still ad hoc.

Why first: the same move that started the PriceKeel guardrail engine, map what is missing before building anything new.

WEEK 2-3

Build the first attribution-backed framework

Take one live monetization trend and build the metrics framework scoring it as risk or opportunity, using SQL and the team's data visualization stack, pressure-tested with the PM and sales partners before it reaches a research topic.

Why now: building it against a real trend, not in a vacuum, is what made the $433M in margin gaps hold at Sensata.

WEEK 4

Ship a research topic that moves goal-setting

Turn that framework into a research topic recommendation with a clear monetization-ROI number attached, so the next business goal-setting cycle starts from a model instead of an anecdote.

Why this fast: a monetization analytics function only scales once its calls are defensible enough for Finance and Sales to act on without a rerun.

CLOSE

You are hiring someone to turn monetization data into a metrics framework that tells risk apart from opportunity. I have already run that loop at comparable scale.

The core proof is Sensata: a **$627M-opportunity Power BI model** built from scratch, scoring 1,200 line items and surfacing **$433M in margin gaps**, with $700K+ recovered once leadership acted on it.

What is harder to find is someone who has also run attribution as a production problem: **Appsflyer and Adjust** for mobile UA, **Amplitude and Tableau** for behavioral analysis, at Pixis, and who has built the risk-versus-opportunity classifier itself as a company at **PriceKeel**.
