Hiring Team, Amazon Web Services (AWS)

A portfolio-level value proposition only holds up when the technical architecture underneath it actually supports the claim. At Applied Materials, I build forecasting and value-based pricing models from Sales and Engineering input across multiple product groups, and I automate the repetitive side of that analysis with AI agents built on Claude, the same agentic pattern this req is building a data foundation for. The Data Foundations Product Marketing role is asking for that same blend: dive into the technical architecture, then make its value legible to developers, technical decision-makers, and the sellers carrying it to market.

Direct evidence of fit:

- Automate forecasting and competitive analysis with Claude AI agents at Applied Materials, firsthand practice with the agentic AI workflows this role is building a foundation for.
- Built KPI frameworks in SQL and GA4 across 50,000+ connected industrial devices at Sensata, the segmentation and customer-profile work this req lists as a preferred qualification.
- Owned end-to-end GTM for a new, engineering-heavy Sensata product line (positioning, messaging, launch moments, channel), driving $2M+ first-year revenue.
- Armed 50+ reps with technical sales enablement (decks, case studies, battlecards) that lifted win rates 30%, the same enablement motion this role scales to thousands of sellers.

What I bring is practice translating deep technical input into language a buyer and a seller can both act on. I run that translation daily as Strategic Marketing III at Applied Materials, where the leadership decks and OKRs I build carry the same executive-level narrative this role develops for industry events and customer engagements. A data portfolio built for agentic AI only turns into a coherent customer story when someone is doing that synthesis on purpose, and that is the work I want to do here.

Proof trail at adhi-product-ai.vercel.app/ref/aws if you want to see the GTM and enablement work firsthand.
