Hiring Team, Cursor

At Sensata I built the FY2026 Bleeders and Leakers Power BI dashboard that gave leadership visibility into 1,200 pricing opportunities against a \$627M target, ranked by region and product line. I did not stop at the dashboard: I recovered \$700K+ of the margin it surfaced within two quarters by negotiating fixes on live deals instead of just reporting the shortfall. That is the loop your posting describes for the Deal S&O function: spot the pattern across deal flow, surface it to Finance and leadership, then drive the change through.

My opinion on deal desks is that most of them stall on structure, not price. A rep can usually defend a discount; what actually breaks a deal is a contract structure nobody signed off on before it hit Legal's desk. When I repriced Sensata's distributor terms to lift margins from 53% to 61%, the fix only held because Finance and Sales agreed on the structure before it shipped. I ran that same discipline on multimillion-dollar customer quotes with senior executives, where pricing, Finance and Legal all had to align before a deal moved, the kind of executive engagement a \$1M+ ACV enterprise deal runs on.

That is also why I started PriceKeel. I kept watching discount exceptions get approved with no record of why, so I built the audit trail that gives Finance real evidence for the call, and a guardrail engine that catches the exception before it becomes the new normal. I run the company's CRM, CPQ and deal approvals myself, the same approval-workflow and playbook work that keeps a growing deal desk from becoming the bottleneck as volume scales five times over.

I would bring that same pattern, find the structural leak, fix it, make the fix explainable to Finance, to Cursor's Deal Desk. Proof trail at adhi-pricing-ai.vercel.app/ref/cursor.
