PITCH DECK | CRIBL REVENUE OPERATIONS SENIOR ANALYST

Segmentation and territory models are only as trustworthy as the account and opportunity data under them. I already build that data integrity before the model gets built on top of it.

Pipeline diagnostics, Salesforce data integrity, and the business reviews that turn both into decisions a Sales VP will act on.

- **$700K+** margin recovered in 2 quarters off a segmented pipeline at Sensata
- **1,200** opportunities segmented by region, product line and rep against a $627M target
- **PriceKeel** - runs the CRM, CPQ and audit trail behind every deal, founder to admin
- **53% to 61%** channel margin lift from the same data-driven repricing work
- **Claude AI agents** automate recurring reporting work today

WHY THIS DECK EXISTS

The risk in a fast-growing, remote-first GTM org is not that segmentation models exist. It is that the account and territory data under them drifts as the team scales.

What a scaling multi-timezone sales org runs into

Segmentation, territory design and compensation plans get modeled once for annual planning, then nobody keeps the underlying account, opportunity and territory data synced to them as reps, deals and quotas change week to week.

Salesforce, Gong and Omni dashboards quietly drift apart from each other: a field goes stale on one side and nobody notices until a VP questions a number in a business review.

The fix is not another dashboard. It is one person who owns the data-quality work before the strategic model gets built on top of it, and who can defend the number when a VP asks.

What I have already run, hands on

At **Sensata**, I built the Power BI layer that segmented 1,200 opportunities by region, product line and salesperson, so a $627M target stopped being one blended number and became a diagnosable pipeline.

At **PriceKeel**, I run CRM and CPQ myself and documented the audit trail Finance and Sales check every discount decision against, the same discipline a Salesforce workflow needs to stay trustworthy at scale.

At **Plug Power**, I automated the Mar-Tech stack across Salesforce, Adobe Analytics, GA and Google Tag Manager so closed-loop reporting ran without a manual reconciliation every week.

> **Segmentation models, territory design and compensation plans are only as good as the account, opportunity and territory data under them. I build that data integrity first, then the model a Sales VP can actually trust in a business review.**

THE REQ, MAPPED

What the Revenue Operations Senior Analyst opening asks for, and where the proof sits.

What the role covers

> *"Develop segmentation models, territory design and compensation plans to support annual planning."*

> *"Act as a strategic advisor to Sales VPs through business reviews and pipeline diagnostics."*

> *"Maintain Salesforce, Gong and Omni dashboards, and drive CRM workflow and data-quality improvements."*

> *"Maintain the integrity of account, opportunity and territory data across Sales, Finance, Marketing and People."*

My Proof

Sensata Bleeders and Leakers: built the Power BI dashboard segmenting 1,200 opportunities by region, product line and salesperson, with win-rate, avg $/win and stage-distribution reporting for leadership.

PriceKeel CRM and CPQ: set up and run the company's own CRM and CPQ, and documented the audit trail Finance checks every discount call against.

Applied Materials business reviews: build forecasting and market-sizing models across multiple product groups and run the weekly and quarterly business reviews that brief senior stakeholders.

Plug Power data integrity: automated the Mar-Tech stack (Salesforce, Adobe Analytics, GA, Google Tag Manager) for closed-loop reporting that did not drift between systems.

THE SENSATA PROOF, IN DEPTH

One segmented pipeline, one margin-recovery program, one set of numbers a Sales VP could act on.

The Bleeders and Leakers program started as a messy, blended pipeline number and ended as a dashboard a VP could interrogate by region, product line or rep. I built the segmentation, ran the margin-recovery program on top of it, and then shaped the revenue models senior executives used for planning. That is the same chain Cribl's annual planning cycle needs: segmentation and territory data that holds up under a direct question in a business review.

1,200

Opportunities Segmented

By region, product line and salesperson against a $627M target across 3 regions, 4 product families and 20 product lines, with win-rate and stage-distribution reporting.

$700K+

Margin Recovered in 2 Quarters

Running the Bleeders and Leakers program on that segmented data, surfacing $433M in margin gaps for leadership to prioritize by rep and product line.

53% to 61%

Channel Margin Lift

Repricing parts sold through distribution in under 2 quarters, using the same region and product-line segmentation as the underlying diagnostic.

The common thread: segment the data first, run the analysis on top of it, then defend the number with the VP who has to act on it. That is the loop I would bring to Cribl's territory, compensation and business-review cycle.

FIRST 30 DAYS

What the first month on Cribl's Revenue Operations team looks like.

WEEK 1

Trace today's segmentation and data integrity

Map how account, opportunity and territory data flows into the Salesforce, Gong and Omni dashboards today, and flag where a field or definition has drifted between systems before it shows up as a wrong number in a business review.

Why first: the drift is usually visible in the raw data before anyone names it, the same move that started the Bleeders and Leakers segmentation at Sensata.

WEEK 2-3

Fix the highest-drift workflow

Rebuild the CRM workflow or data-quality rule causing the worst drift, document the change, and pressure-test it with the Sales VP and Finance it feeds before it goes live in a business review.

Why now: the same sequence, segment then fix then document, recovered $700K+ in margin at Sensata and held up past the first quarter.

WEEK 4

Run the first pipeline diagnostic

Bring the cleaned segmentation into the next business review as a pipeline diagnostic a Sales VP can act on directly, and set the cadence for keeping territory and account data in sync going forward.

Why this fast: a data fix nobody sees in a real business review does not stick. Putting it in front of a VP in week 4 is what makes it permanent.

CLOSE

You are hiring someone to make segmentation, territory and compensation planning defensible in the room. I have already built and run that exact chain, from the raw data to the business review.

The core proof is Sensata: a **Power BI dashboard segmenting 1,200 opportunities** by region, product line and salesperson against a $627M target, and a **$700K+ margin recovery program** built on top of it.

What is harder to find is someone who also runs the data layer underneath that kind of model today. I set up and operate **CRM, CPQ and the audit trail behind it as founder of PriceKeel**, which means the data-integrity instinct this role needs is not something I would develop on the job.
