Hiring Team, Jerry

Your posting describes a program built around owning a new vertical end to end, with no team to lean on until you build one. That is the exact shape of the only project I have ever run completely alone: I built SwipeHire, an AI job-matching platform, from a blank page to 50 early users, writing the PRD myself, scoping the MVP, and shipping auto-tailored resumes and personalized matching without a cofounder or a team.

I have also run that same ownership inside a larger company. At Sensata I carried a 100+ feature backlog through PRDs with engineering across three regions, ran 30+ customer interviews with OEMs and distributors to find the pain points worth building for, and used what I learned to launch GTM for a new product line that drove \$2M+ in first-year revenue. Each of those was a new vertical someone handed me with more ideas than hands to execute them, which sounds a lot like the problem this program exists to solve.

Right now at Applied Materials I build the forecasting and market-sizing models that validate an opportunity before anyone commits engineering time to it, and I automate the repetitive parts of that work with AI agents built on Claude so the judgment calls get the hours. I am comfortable being in Palo Alto alongside the team while I learn the ropes, and I am looking for exactly the kind of compressed, high-ownership exposure to product, growth, operations and finance that this role is built around.
