Hiring Team, Applied Materials

As a current Applied Materials Strategic Marketing III, I'm writing about the Product Manager II opening on the Etch Service Business Unit team. The scope lines up closely with work I already do inside the company: sizing the semiconductor market with Engineering, Sales and Accounts, building forecasting and market-sizing models across multiple product groups, and turning field and technical signals into one prioritized view of demand. I'd like to put that same discipline to work on service-product commercialization specifically, where the installed base and the customer relationship are the whole business.

Your posting asks for product requirements, value propositions, pricing recommendations and go-to-market plans, and that is the shape of work I came up through. At Sensata I owned the sensor product roadmap and managed a 100+-feature backlog with Engineering across 3 regions, which cut time-to-market 20% and sped releases 25%. I also ran the GTM for new sensing products, positioning, pricing, channel and launch, to \$2M+ first-year revenue, and built the value-based pricing recommendations that fed every launch plan.

Customer engagement has been a constant too: 30+ interviews with OEMs and distributors at Sensata that raised CSAT 22%, and reporting voice-of-customer findings straight to product and senior leadership at Pixis. I run that same cross-functional motion today with Engineering, Sales and Accounts at Applied Materials, and the forecasts and management presentations that come out of it feed directly into portfolio and operating-plan decisions, the same inputs this role is built to support.

Etch's service business is the kind of problem I like: a real installed base, real customer relationships, and a commercialization motion that needs market analysis and pricing judgment as much as a roadmap. I'd welcome the chance to talk about where I could help the team. Proof trail at adhi-product-ai.vercel.app/ref/applied-materials.
