Hiring Team, Mercury

A credit card only works if people choose to keep using it past the first swipe. I built that same choose-to-use bar into SwipeHire, a job-matching platform I took from a blank PRD to 50+ onboarded users, running 8+ A/B tests and 12+ interviews against the activation funnel I instrumented myself, with no team to lean on when something did not land.

That same where-money-moves-and-a-mistake-is-costly judgment is what I carried at Sensata, shaping multimillion-dollar customer quotes with senior executives while owning P&L and revenue targets for a multi-$100M business and turning competitive benchmarking into a price-realignment model that drove 12% YoY revenue. Approval decisions and line assignments ask for the same close attention to what a number actually means before it moves.

Shipping something new also means pulling the right people in at the right moment. At Applied Materials I partner with Engineering, Sales and Accounts to turn fragmented field and technical signals into one prioritized market view, and I run Claude-built AI agents there to automate the repetitive side of my own analysis, a realistic read on where AI actually speeds a workflow up instead of just sounding impressive in a product description.

I would like to bring that same launch discipline, financial judgment and AI-shipping instinct to Mercury's first credit card. Proof trail at adhi-product-ai.vercel.app/ref/mercury.
