Hiring Team, Google

When Sensata needed sensor hardware launched across three regions without the timeline slipping, I didn't wait for a settled spec. I ran the 100+ feature backlog with engineering and design in Agile, cut time-to-market 20%, and ran 30+ customer interviews with OEMs and distributors that raised CSAT 22%. That is the loop your posting describes for XR: take a fuzzy consumer signal, turn it into a shipped feature, then measure whether it actually moved the experience.

I have also worked the retail side of that loop, not just the engineering side. At Pixis I ran retail media (Amazon Ads, Criteo) and iOS app UA for an 8-client portfolio, and at Sensata I repriced through distributors and channel partners, raising their margins from 53% to 61% in under two quarters. Partnering with a channel partner on pricing and partnering with one on a product launch pull on the same relationship, just a different lever, and I know which questions a partner executive wants answered before they sign off.

Right now at Applied Materials I build the forecasting and market-sizing models that sit between Engineering, Sales and Accounts, and I automate the repetitive parts of that work with AI agents built on Claude so the hours go to judgment calls instead of spreadsheets. Your team is building AI directly into the XR experience itself; I have been building it into my own workflow, and I'd rather bring that habit to the product than keep it to myself.

I'd like to bring that same loop, cross-functional backlog ownership, retail partner relationships, and a habit of measuring before claiming a win, to the XR consumer experience team.
