Hiring Team, Siemens EDA

At Applied Materials, I size the semiconductor market with Sales, Engineering and Accounts, then build the value-based pricing that keeps pace with it, forecasting the inflection points where chiplet-driven demand outruns a list price written for last year's roadmap. Your posting opens the same way: read the market trends and competitive threats early enough that they shape the go-to-market strategy for Innovator3D IC instead of reacting to it after a competitor moves.

Before Applied Materials, I owned the GTM for Sensata's new sensing products, positioning and launch plan included, and the reason conversion moved 15% on the launches I owned is that I turned the technical spec into a value proposition an engineer could sign off on and a buyer could act on. Signal and power integrity in a heterogeneous chiplet stack is a harder story than a sensor spec sheet, but the job is the same one your posting describes: find the handful of sentences that make a complex technical story land with both the design engineer and the procurement lead, then carry that story into sales materials and field marketing.

I've run that cross-functional loop end to end before: 30+ customer interviews with OEMs and distributors, competitive analysis across EMEA and the US, and sales enablement for 50+ reps ahead of a launch. I'd bring the same habit to the Innovator3D IC family, working close enough with Market Development, Product Strategy and the account teams that messaging, pricing and packaging plans, customer collateral, and the trade show calendar all point at one story instead of three.
